## SECTION V. PETROLEUM

Petroleum products commonly used		
in theaters of operation .....	20	72
Conversion table, oil, gasoline and		
grease .....	21	74
Gasoline equivalents .....	22	75
Estimate of requirements .....	23	75
Factors controlling gasoline		
requirements .....	24	77
Use of experience tables .....	25	78
Class III requirements for am-		
phibious operation .....	26	79
Space requirements for a Class III		
depot .....	27	81
Dimensions of standard POL		
containers .....	28	83
Weights, volumes and conversion		
factors .....	29	84
Collapsible containers .....	30	86
Storage tanks .....	31	87
Dispensers .....	32	88
Transportation, rail and motor .....	33	89
Pipe lines .....	34	90
Air .....	35	91

## SECTION VI. WAREHOUSING

Space layout .....	36	92
Aisles arrangement .....	37	93
Space requirements .....	38	94
Determining square foot allocation	39	97
Determining maximum stacking		
height .....	40	97
Floor loading .....	41	97
Types and sizes of paulins .....	42	101
Materials handling equipment .....	43	102

## SECTION VII. PACKAGING AND CRATING

Processing and prepackaging .....	44	117
Interior container types .....	45	118

SECTION VII.—Continued

Exterior container types .....	46	119
Selection of shipping containers....	47	120
Strapping .....	48	120
Woods .....	49	122
Nails .....	50	124
Nails and lumber for styles, 1, 2, 2½, 4 and 5 nailed wooden boxes (type 3) .....	51	128

SECTION VIII. GRAVES REGISTRATION

General .....	52	129
Recovery and evacuation .....	53	129
Identification .....	54	130
Personal effects .....	55	131
Temporary military cemeteries ..	56	131
Burials .....	57	132

SECTION IX. TRANSPORTATION

Motor transportation .....	58	134
Rail transportation .....	59	138
Water transportation .....	60	145
Air transportation .....	61	147

SECTION X. TABLES OF WEIGHTS, MEASURES AND  
CONVERSIONS

Weights and measures of various rations .....	62	151
Conversion of U. S. to metric measure .....	63	163
Conversion of metric to U. S. measure .....	64	164
Miscellaneous conversions .....	65	165
Temperature conversion .....	66	165
Cubic measure .....	67	165
Square measure .....	68	166
Linear measure .....	69	166
Volume .....	70	166
Mariner's measure .....	71	166

# SECTION I

## INTRODUCTION

---

### 1. PURPOSE

The Quartermaster Corps embraces many diversified subjects each of which is a detailed operation requiring technical skill and knowledge. This manual is designed to provide statistical type information for use in planning for quartermaster operations in theaters of operation.

### 2. SCOPE

This manual includes data on class I, II, III, and IV supply, packaging and crating, and other information pertinent to quartermaster operations.

## SECTION II

### QUARTERMASTER SUPPLY, GENERAL

---

#### 3. SUPPLY CATALOGS

a. The following are Quartermaster Sections, DA Supply Catalogs:

- QM 1 Introduction and Index (a guide to all sections of the system with explanation of their use).
- QM 3-1 List of Items for Troop Issue—Enlisted Men's Clothing and Equipment.
- QM 3-2 List of Items for Troop Issue—Wacs' and Nurses' Clothing and Equipment.
- QM 3-3 List of Items for Issue to Posts, Camps and Stations.
- QM 3-4 List of Items for Issue to Troops—Miscellaneous Organizational Equipment.
- QM 5 (Stock) List of Items.
- QM 5-1 Pricing Guides.
- QM 6 Chest, Kits, Outfits and Sets.
- QM 7 Organizational Maintenance Allowances.
- QM 8 Field and Depot Maintenance Allowances.
- QM 9 List of All Parts.

b. Quartermaster Section 5, DA Supply Catalog is published in the form of a separate catalog for each distinct class of articles. The table in paragraph 4 indicates the individual classes.

#### 4. CLASS NUMBERS

Class number	Items
5	FLAGS AND BUNTING.
7	FUEL. Gasoline and oil (including kerosene and diesel oil) etc.
11	PUMPS AND THEIR PARTS.
13	ENGINE-ROOM AND FIRE-ROOM FITTINGS, SUPPLIES, AND TOOLS.
14	OILS. Greases, illuminating oils, and all lubricants.
17	ELECTRIC APPARATUS—and all accessories, outfits, and parts.
18	INSTRUMENTS OF PRECISION—and all accessories, outfits, and parts.
19	BLOCKS AND RIGGING—and all accessories, outfits, and parts.
21	CORDAGE. Hemp, jute, oakum, twine—including manufactured articles.
22	ROPE WIRE AND WIRE, BARE—including manufactured articles.
24	DUCK. Canvas, tentage—including manufactured articles and accessories.
25	RESALE ARTICLES.
26	FURNITURE.
27	DRY GOODS AND TEXTILES. Bedding, buttons, curtains, cushions, draperies, findings, floor coverings, linoleum, notions, oilcloth, trimmings, upholstery, yarns, etc.
28	BLANK FORMS.
29	TOILET ARTICLES—and all accessories, outfits, and parts.
30	BATHROOM AND TOILET FIXTURES—and all accessories, outfits, and parts.

Class number	Items
31	LIGHTING APPARATUS (nonelectric)—and all accessories, outfits, and parts.
32	FIRE-SURFACING AND HEAT-INSULATING MATERIAL.
33	GASKETS, HOSE, HOSE FITTINGS, PACKING, RUBBER (sheet and strip), and TUBING (flexible)—including manufactured articles.
34	LEATHER. Belting, harness, and saddlery—including manufactured articles.
35	BOOKS. Blueprints, charts, drawings, libraries, maps, newspapers, periodicals, professional publications, etc.
36	MUSICAL INSTRUMENTS. Music and all accessories, outfits, and parts.
37	ATHLETIC EQUIPMENT. Recreational apparatus, sporting goods, and special wearing apparel.
38	BROOMS AND BRUSHES.
39	LUMBER, TIMBER. Wooden barrels, boxes, cases, crates, etc.
40	TOOLS, MACHINE. Bending rolls, drop hammers, drills, grinders, lathes, milling machines, planers, presses, punches, riveters, rolling machines, saws, shears, etc.—including all accessories, outfits, and parts.
41	TOOLS, HAND.
42	HARDWARE (builder's general).
43	BOLTS, NUTS, RIVETS, SCREWS, AND WASHERS.
44	PIPE, TUBES, TUBING (Nonflexible).
45	PIPE FITTINGS.
46	METAL IN BARS (flat, hexagon, octagon, round, square). Billets, ingots, pigs, and slab.
47	METAL IN PLATES AND SHEETS.
51	ACIDS, CHEMICALS, DRUGS, CASES, SOAPS. Abrasive materials and cleaning, cutting, and polishing compounds.
52	PAINTS AND PAINT INGREDIENTS.

Class number	Items
53	STATIONERY. Bags, paper; books, blank; boxes, paper; cartons; and supplies for drafting rooms, offices, and printers.
54	OFFICE EQUIPMENT. Adding machines, cash registers, numbering machines, typewriters, etc.
55	TEXTILE CLOTHING AND KNITTED GOODS.
56	FOOD. Groceries, ice, provisions, and subsistence.
58	RAILWAY, DOCK, AND YARD EQUIPMENT—including fire-fighting apparatus.
60	BOILERS AND ENGINES (power plant and ship)—and all accessories, outfits, and parts.
62	ARTICLES OF SPECIAL VALUE. Bullion, jewelry, museum collections, paintings, precious stones and metals, statuary, works of art, etc.
63	TABLEWARE (barracks, crew's mess, hospital, hotel, officers' mess, ship saloon). Aluminumware, china-ware, corrosion-resisting steelware, glassware, and silverware.
64	BAKE-SHOP AND KITCHEN APPARATUS. Aluminum utensils, corrosion-resisting steel utensils, galley gear, tinware, and all accessories, outfits, and parts.
65	OVENS, RANGES, AND STOVES—and all accessories, outfits, and parts.
66	MACHINERY AND EQUIPMENT.
67	FORAGE. Bulbs and roots, plants, shrubs and trees, and seeds.
68	LIVESTOCK.
69	VEHICLES (animal and hand-drawn)—and all accessories, outfits, and parts.
70	AGRICULTURAL IMPLEMENTS—and all accessories, outfits, and parts.
71	INSIGNIA. Badges, medals, etc.
72	BOOTS, SHOES, AND LEATHER AND RUBBER CLOTHING.
73	CAPS, HATS, GLOVES, AND MEN'S AND WOMEN'S FURNISHINGS.
74	INDIVIDUAL EQUIPMENT (field and landing-force).

Class number	Items
79	BLANK FORMS (for general issue).
91	SPARE PARTS; MOBILE EQUIPMENT.
98	REHABILITATION CLOTHING FOR LIBERATED COUNTRIES.
99	RESALE ITEMS. Clothing for oversea shipment.

## 5. DAY OF SUPPLY

A day of supply is the quantity of supplies estimated to be required for 1 day under the conditions of the operation and for the force stated. The following table is a basis for considering general requirements, and requirements of temperate, amphibious, jungle, and polar operations.

Item	Pounds per man per day	Tons per man per month	Conversion factor <sup>1</sup>	Measurement tons per man per month	Measurement tons per man per month with 15 per cent stowage
<i>General Quartermaster Requirements</i>					
Class I:					
Rations-----	5.33	0.080	2.1	0.168	0.193
Class II:					
Quartermaster clothing and equipage-----	.84	.013	2.9	.038	.044
Quartermaster general supplies-----	.60	.009	2.8	.025	.029
Total class II-----	1.44	.022	-----	.063	.073

See footnotes at end of table.

Item	Pounds per man per day	Tons per man per month	Conversion factor <sup>1</sup>	Measurement tons per man per month	Measurement tons per man per month with 15 per- cent stowage
<b>Class III:</b>

Total class II.....	1.250	.019	-----	.055	.064

See footnotes at end of table.

Item	Pounds per man per day	Tons per man per month	Conversion factor <sup>1</sup>	Measurement tons per man per month	Measurement tons per man with 15 per- cent stowage
Class III:					
Gas, oil, grease, compounds-----	9.000	.135	1.5	.203	.233
AF fuel and lubricants <sup>3</sup> -----	14.000	.210	1.5	.315	.362
Total class III-----	23.000	.345	-----	.518	.595
Class IV:					
Quartermaster sales items-----	2.000	.030	1.7	.051	.059
TOTAL-----	36.650	.550	-----	.952	1.095

<sup>1</sup> Conversion factors are based on average cubage for each item. Measurement tonnage (40 cu. ft.) weight of any item can be found by multiplying the short ton (2,000 lb.) weight of the item by the conversion factor of the item.

<sup>2</sup> Grease and lubricants 2 percent; gasoline and oil 98 percent.

<sup>3</sup> Class III A.

<sup>4</sup> Estimated, based on Arctic test operations.

# SECTION III

## SUBSISTENCE

### 6. RATION DATA

Type of ration	Per package data			Average weight per ration		Remarks
	Number rations	Weight (lb)	Volume (cu ft)	Packed (lb)	Unpacked (lb)	
Field, type A-----	-----	-----	-----	6.0	5.2	This is the basic field ration. Components, weight, and volume may vary. Normally, contains maximum of fresh meats, dairy products, fruits, and vegetables, and other perishables.
Operational, type B-----	-----	-----	-----	5.3	4.3	Same as field ration, with nonperishable items substituted for perishable items.

See footnotes at end of table.

Type of ration	Per package data			Average weight per ration		Remarks
	Number rations	Weight (lb)	Volume (cu ft)	Packed (lb)	Unpacked (lb)	
Small detachment, type 5-in-1.	5	29.0	0.8	5.8	3.7	Nonperishable precooked or prepared food which may be eaten hot or cold.
Individual, combat, type C-4.	6	41.0	1.1	6.8	4.1	Nonperishable precooked or prepared food which may be eaten hot or cold. Recommended duration of use: 2 days maximum.
Food, packet, individual, assault, IA-1*.	24 packets	39.0	1.1	-----	-----	Nonperishable precooked or prepared food which may be eaten hot or cold. Packaged so as to be carried by the individual. Recommended duration of use: 1 day.
Food packet, individual, survival**.	-----	-----	-----	-----	-----	Nonperishable precooked or prepared food which may be eaten

Sundries, pack**					hot or cold. Packaged in man- ner suitable for attachment to cartridge belt or carrying in pocket.
					Composed of essential toilet arti- cles, tobacco, and confections necessary in health and comfort of troops.
Spice pack, kitchen	Supple- ment 1,000 rations	40.0	1.2		Provides spices and condiments for 1,000 field or operational type B rations.
Special items pack, hos- pital (hospital supple- ment ration).	25	50.0	1.4	2.0	Composed of fruit juices, soups, milk, etc., required as special nourishment for hospital pa- tients.
Special items pack, aid station (beverage pack, aid station).		40.0	1.0		Composed of fruit juices and simi- lar liquid diet items required for patients.

\* Based on tentative specification. Not a complete ration.

\*\* Not yet standardized.

## 7. TIME ELEMENT IN CLASS I SUPPLY

The figures given in the following table are an approximate average for combat conditions; however, they should be used as a guide only where actual experience is lacking:

Work	Daylight (min.)	Dark (min.)
Unloading rations for one division at class I supply point and preparing for distribution to regiments or separate battalions.	120	150
Distribution of class I supplies to regiment by higher echelon at one supply point.	30	30
Distribution of class I supplies to separate battalion by higher echelon or similar unit.	15	15
Preparation of 1 day's class I supplies for issue at regimental or battalion class I supply point.	30	60
Distribution by regimental supply agencies of one field ration (transfer of loads) to kitchens.	15	20
Kitchens to be taken off trucks, set up, and made ready to begin cooking (or vice versa).	20	20
Division of one ration into three meals at kitchens.	15	20
Kitchens (starting hot) to cook and prepare for serving a hot meal.	120	150
Kitchens to prepare a cold noon meal, the issue of the meal to take place usually coincident with the serving of breakfast.	60	90
Serving a hot meal to men from a kitchen truck when majority of men are served at the truck.	45	60
Serving a hot meal to men by means of carrying parties, assuming the kitchen truck not farther than 1,000 yards in rear of the company.	90	120

RATION BREAKDOWN CHART  
(strength)

## 8. RATION BREAKDOWN CHART

The ration breakdown chart is exceedingly useful for making rapid and accurate computations of issue. In using the chart it is recommended that a straight-edge or rule be used. For example: assume a ration strength of 2,187 men. One of the items to be issued is evaporated milk at 32 cans per 100 men. Place the lower guide along the line marked 32 on the left. Now take the amount at the intersection of the 2,000 strength column, which is 640; next, at the intersection of 100, which is 32; next, at the intersection of 80, which is 25.6; and then, at the intersection of 7, which is 2.24. The total is 699.84 cans, allowance for 2,187 men.

## 9. SUBSISTENCE STORAGE DATA

The following table is based on storage experience in the United Kingdom:

*a. Subsistence items best suited for open storage.*

Item	Unit	Item	Unit
Apple butter.....	Can.	Eggs, dehydrated....	Can.
Apple nuggets.....	Do.	Figs.....	Do.
Applesauce.....	Do.	Fruit cocktail.....	Do.
Apricots.....	Do.		
Bacon.....	Do.	Grapefruit juice.....	Do.
Beans, lima puree....	Do.	Grape juice.....	Do.
Beef:		Hash:

## 10. REFRIGERATION DATA

### *a. Requirements.*

- (1) Each man will require approximately 3 cubic feet of refrigerated storage space per month of supply.
- (2) Ice requirements (where ice is required) are approximately 2 pounds per man per day.

*b. Army field refrigerators.* The following table gives information on portable units for storage and transportation of foods in a theater of operations.

Model	Name	Net volume (cu. ft.)	Max. no. men served		Weight (lb.)		Dimensions net (in.)	Ship- ping volume (cu. ft.)	Kind of power	Remarks
			Stor- age	Ship- ment	Net	Ship- ping				
A	Refrigerator, kerosene.	6	24	-----	400	480	36 x 22 x 60.	56	Kerosene----	At 35° F. and above, offers maximum convenience for hospitals in temporary locations. It is too small for mess service, though relatively heavy. It needs little service but requires proper fuel and cleaning of oil burner.
B	Container, frozen- beef, insulated. <sup>1</sup>	12	-----	150	150	200	50 x 40 x 22	25	None-----	Holds eight boxes (400 pounds) of frozen boneless beef. It is recommended for frozen foods from warehouse to point of consumption by truck or air. Frozen food will remain edible for 1 week in it if reasonably protected from the sun. Container is made of plywood, with metal interior,

See footnotes at end of table.

Model	Name	Net volume (cu. ft.)	Max. no. men served		Weight (lb.)		Dimensions net (in.)	Shipping volume (cu. ft.)	Kind of power	Remarks
			Storage	Shipment	Net	Shipping				
	Refrigerator, chest-type, portable.	25	100	300	1,500	2,400	94 x 38 x 67	205	Gasoline----	and is ruggedly constructed. Being light in weight, it is easy to handle. It may be used as a field ice box.  It is a rugged, hand-started refrigerator, portable by air. It is equipped with holdover plates set for 10° F. in 1944 models and for 10° to 40° F. 1945 models; temperature may be converted only by changing solution. It is designed for the shipment and limited storage of frozen beef and for occasional use as mess refrigerator by isolated units of less than company strength. Two refrigerators may be mounted on a 2½-ton

D	Refrigerator, reach-in, portable.	50	200	-----	850	1, 650	81 x 38 x 66	130	Gasoline or electricity.	It is a lightweight refrigerator for organizational messes, with automatic operation for temperatures of 30° to 40° F. It is ideal for kitchen service, being equipped with removable food shelves and meat hooks, as well as a separate ice cube compartment which will freeze 48 pounds of ice in 24 hours. The electric power requirement is 110 volts, 50-60 cycles, alternating current, 1 phase. The refrigerator can be knocked down in 20 minutes into four packages.
E	Refrigerator, walk-in, portable.	150	600	1, 800	3, 900	5, 400	105 x 71 x 82	450	do.-----	It is a heavy, rugged, over-powered refrigerator designed for severe outdoor use with low maintenance. It is a fully automatic

See footnotes at end of table.

Model	Name	Net volume (cu. ft.)	Max. no. men served		Weight (lb.)		Dimensions net (in.)	Shipping volume (cu. ft.)	Kind of power	Remarks
			Storage	Shipment	Net	Shipping				
F	Semitrailer, refrigerator, 10-ton, 2-wheel.	600	2,400	6,000	7,500	8,000	246 x 97 x 109	1,340	Gasoline	blower-type refrigerating system, with temperature range from 10° to 40° F. It is designed for temporary organizational storage warehouse or for shipment of foods by truck or ship. It will operate in transit. It may be mounted on a 2½-ton truck. (Aluminum construction of the 1945 models reduces the weight from 3,900 to 2,000 pounds)
										It is a tough, rugged, long-haul refrigerator, with a capacity of 15,000 pounds of frozen boneless beef. It is a fully automatic, blower-type, plug-in refrigerating unit, with a temperature range from 10° to 40° F. The semitrailer can

G	Warehouse, refrigerated, prefabricated. <sup>2</sup>	600	2,400	----- <sup>2</sup> 5,706	<sup>2</sup> 7,565	108 x 144 x 90	<sup>2</sup> 472	Gasoline or electricity.	This refrigerated warehouse is a well-insulated, knock-down, walk-in refrigerator for use under cover or as a separate building. It is fully automatic with a temperature range from 10° to 40° F. It is powered by a plug-in self-contained refrigerating unit of the blower type. It is suitable for the storage of frozen or perishable foods for long or short periods to supply kitchens in immediate or more remote locations.
H	Warehouse, refrigerated, prefabricated. <sup>2</sup>	1,800	7,200	----- <sup>2</sup> 12,140	<sup>2</sup> 15,334	292 x 144 x 90	<sup>2</sup> 1,048	-----do.-----	This refrigerated warehouse is identical with the model G except that it provides

See footnotes at end of table.

			Stor- age	Ship- ment	Net	Ship- ping			
I	Warehouse, refrigerated, prefabricated. <sup>2</sup>	3,200	12,800	-----	21,300	26,165	522 x 144 x 90	2,603	-----do-----
									two rooms and requires two plug-in mechanical units. The prefabricated sections permit the location of doors, walls, and plug-in units as local conditions make desirable. Multiple rooms may be adapted for the storage of both frozen foods and fresh or perishable foods in separate rooms. (For installations where still more storage is required, larger models, of 7,000 and 14,000 cubic feet, may be built from standard plans if materials are available.)
									This refrigerated warehouse is identical with the model G except that it provides three rooms and requires

three plug-in mechanical units. The prefabricated sections permit the locations of doors, walls, and plug-in units as local conditions make desirable. Multiple rooms may be adapted for the storage of both frozen foods and fresh or perishable foods in separate rooms. (For installations where still more storage is required, larger models, of 7,000 and 14,000 cubic feet, may be built from standard plans if materials are available.)

The ice cream plant will make and store 640 half-pint servings of ice cream a day. It is of rugged aluminum construction. It uses standard quarter-master ice cream mix, shipped dry in cans and packed with half-pint folded cartons. It may be transported by air or truck.

J	Plant, ice cream, portable.	2.5-40 gal.	1,300	2,000	80 x 32 x 56	130	-----do-----	
---	--------------------------------	----------------	-------	-------	--------------	-----	--------------	--

See footnotes at end of table.

Model	Name	Net volume (cu. ft.)	Max. no. men served		Weight (lb.)		Dimensions net (in.)	Shipping volume (cu. ft.)	Kind of power	Remarks
			Storage	Ship-ment	Net	Shipping				
K	Plant, ice, portable.	1 ton/day			8,700	10,250	159 x 50 x 54	350	Gasoline	The portable ice plant is a ruggedly constructed, self-contained unit, complete with calcium chloride required to make brine. A 3.6- and a 15-ton plant are also available.
L	Unit, plug-in, for refrigerated warehouse.				2,200	3,800	48 x 44 x 81	220	Gasoline or electricity.	The unit is used with the prefabricated refrigerated warehouse, one unit being used with the model G warehouse, two with the model H warehouse, and three with the model I warehouse.

<sup>1</sup> Storage capacity at .25 cubic feet per man; shipping capacity computed on basis of frozen boneless beef 2.5 pounds delivered weekly.

<sup>2</sup> Without plug-in unit, model L.

## 11. CANNED FOOD DATA

*a. Dimensions, capacities, and conversion factors of cans.* The dimensions, capacities, and conversion factors of cans most commonly used in the canning of fruits and vegetables are shown in the following table:

Name	Dimensions*	Water capacity at 68° F. (oz.)	Can equivalents			Cans per case
			No. 2	No. 2½	No. 10	
6Z.....	202 x 308	6.08	0.295	0.203	0.056	48
8Z short.....	211 x 300	7.93	.386	.266	.072	48, 72
8Z tall.....	211 x 304	8.68	.422	.291	.079	36, 48, 72
No. 1 picnic.....	211 x 400	10.94	.532	.367	.100	48

No. 5.....	502 x 510	59.1	2.8744	1.983	.540	12
No. 10.....	603 x 700	109.43	5.325	3.673	1.000	6

\*The first group of digits of column 2 represents the outside diameter of the can; the second group, the height of the sealed can. The first digit of each group represents inches; the second and third digits of each group represents sixteenths of an inch. For example, the 6Z can is 2½ inches in diameter and 3¾ inches in height.

*b. Case equivalents.* The can equivalents of table 11, column 4, indicate the number of cans needed to equal each of the cans designated in column 1. The No. 2 and No. 2½ case equivalents may be obtained by dividing the number of cans per case (column 5) of the can to be converted by 24 and multiplying the

result by the can equivalents. The following table gives the case equivalents of the more commonly used cans.

Cans (No. per case)	Case equivalents		
	No. 2	No. 2½	No. 10
8Z tall (48)-----	0.84	0.58	0.63
8Z tall (72)-----	1.27	.87	.95
8Z short (48)-----	.77	.53	.58
8Z short (72)-----	1.16	.80	.86
No. 1 (picnic) (48)-----	1.06	.73	.80
No. 1 tall (48)-----	1.63	1.12	1.22
No. 1 square (24)-----		.58	.63
No. 211 cylinder (48)-----	1.32	.91	.99
No. 300 (24)-----	.74	.51	.56
No. 303 (24)-----	.82	.57	.62
No. 303 (36)-----	1.23	.85	.92

No. 3 (24)-----	1.71		1.28
No. 3 cylinder (12)-----	1.26	.87	.94
No. 10 (6)-----	1.33	.92	

## SECTION IV

### QUARTERMASTER SUPPLIES AND EQUIPMENT

---

#### 12. ISSUE, REPLACEMENT, AND CONSUMPTION

*a. Initial issue.* The initial issue of equipment is the provision of equipment approved for issue to troops or other using agencies who have not previously been supplied such equipment. Initial issue include issues to new inductees, issues to newly activated units, issues of new standardized items, issues arising from increases in allowances due to changes in tables of organization and equipment and tables of allowances, items approved for issue in excess of the quantity authorized in approved tables, and items approved for issue to units for which there are no approved tables.

*b. Replacement issue.* The replacement issue of equipment is that portion of the issues made to troops or other using agencies which replaces equipment previously supplied in order that the standards of efficiency prescribed by the Department of the Army will be maintained. Such issue includes replacement of unserviceable equipment, replacement of losses due to wearing out beyond economical repair, abandonment, destruction, enemy action, pilferage, etc.

*c. Consumption issue.* Consumption issue is the issue of an expendable item.

*d. Replacement factors.* A replacement factor is a number, expressed as a decimal, which, when multiplied by the total projected quantity of an item in use, gives the quantity of that item required to be replaced during a given period of time. Replacement factors are usually expressed on a monthly basis.

*e. Consumption rate.* A consumption rate is the average quantity of an item expended or consumed during a given time interval expressed in quantities per applicable basis. Typical bases of consumption rates are gallons per man per day, pounds per man per day, quantity per 1,000 men per month, etc.

*f. Adjustment of replacement factors.* The authorized initial allowances to which replacement factors for clothing and individual equipment apply are listed in the following manner: If the factor is .083 and the initial allowance per individual authorized the item is 2, the replacement factor appears as .083/2. The allowances shown apply only to those individuals who are authorized the item. Should the allowance be changed, the replacement factor must be increased or decreased in inverse ratio to the difference in initial allowance. The following equation may be used to compute the adjusted Z/D or oversea command replacement factor:

$$\text{Adjusted factor} = \frac{\text{Published factor} \times \text{Published allowance}}{\text{command allowance}}$$

*g. Components of chests, kits, outfits and sets.* No factors are shown for complete chests, kits, outfits,

and sets, as replacements for these items are made by components only.

*h. Tables.*

- (1) The replacement factors and consumption rates published in SB 38-4-QM, "Replacement Factors, and Consumption Rates—Quartermaster Corps," are specifically based on the assigned missions of the designated requisitioning agencies and areas, and are designed to reflect the replacement and consumption requirements to meet the demands of such requisitioning agencies and areas. The tables to be found in SB 38-4-QM are—

(a) *Replacement factors for—*

1. Clothing, Enlisted Women's.
2. Clothing, Officers', Women's
3. Musical Instruments.
4. Materials Handling Equipment.
5. Petroleum Handling Equipment.

(b) *Consumption rates for expendable supplies:*

1. Miscellaneous Expendable Supplies Except Insect and Rodent Control Items.
2. Laundry Supplies—Items Used Exclusively for Laundry and Dry Cleaning Purposes.
3. Insect and Rodent Control Items.
4. Repair Supplies and Equipment.
5. Major Petroleum Products.

### 13. REPLACEMENT FACTORS, MEN'S CLOTHING (SELECTED ITEMS)

Item	Unit	Zone of interior	Semitropical and tropical bases	Cold weather bases

## 17. STORAGE DATA

The following list is based on storage experience in the United Kingdom. These items are suitable for open storage.

*a. Individual clothing.*

Overshoes, arctic

*b. Organizational clothing.*

Gloves, waterproof, rubberized

Headbands, helmet, steel, M1

Helmet, steel, M1 (body)

Liners, helmet, steel, M1

Mittens, asbestos

*c. Individual equipment.*

Bag—

Barracks

Field, canvas, olive-drab

Belts—

Cartridge, .30-caliber (dismounted)

Cartridge, .30-caliber (mounted)

Magazine, BAR

Pistol, revolver, or carbine

Cans, meat

Canteens

Carriers, pack

Covers, canteen—

Dismounted

Mounted

Cups

Haversacks

Pockets, magazine, double-web

Pouches, first-aid

Rolls, bedding, waterproof

Straps, carrying, bag, field

Suspenders, belt

Tags, identification

Tent, shelter-half

*d. Miscellaneous organizational equipment.*

Axes, entrenching

Bags—

Mail, canvas

Water-sterilizing, canvas

Bandoleer, gas-grenade

Bar, sandfly

Basins, canvas, folding

Buckets, canvas, folding, 8-quart

Carrier—

Ax, entrenching

Pick-mattock, entrenching

Shovel, entrenching

Wire-cutter

Case—

Dispatch, canvas

Magazine, 50-round, with shoulder strap

Magazine, 5-pocket, 20-round

Clubs, MP

Flies, tent

Machetes, 18-inch-blade, M1942

Paulins, canvas (large)

Pick-mattock, entrenching

Pins, tent

Poles, tent (all types)

Ropes, drag, with shoulder strap

Scabbards—

Bolo

Rifle

Sub-machine-gun

Screens, latrine, complete with pins and poles

Sheath, machete

Shovel, entrenching

Sling—

Bugle or trumpet

Carrying, machine-gun and ammunition

Web, for colors

Tents (all types)

*e. Barrack equipment.*

Bedstead, single, aluminum-finish

Cots, folding, canvas

*f. Regular supplies.*

Arrester, spark

Ax—

Camp or hunter, handled

Hand, single-bit, standard grade, 4-pound

Bars—

Crow, pinch-point

Crow, wedge-point

Wrecking, type D, gooseneck,  $\frac{3}{4}$ - by 24-inch

Basins, wash

Brooms—

Corn

Push, rattan, without handle

Brushes—

Dust, counter

Kitchen, wire

Marking

Sanitary or toilet, type II, 17-inch handle

Scrubbing, floor

Sweeping, floor, without handle, 18-inch

Buckets, general-purpose, galvanized, 14-quart, without lip

Bulb, electric, lantern, hand

Candles, type 2

Cans, galvanized—

10-gallon, with cover

16-gallon, with cover

24-gallon, with cover

32-gallon, with cover

Cement, liquid, tent-patching

Cleavers, butcher, 8-inch blade

Container, water, 5-gallon

Compound, rust-preventive

Cups, coffee

Diggers, post-hole

Dippers, tea, 2-quart

Disinfectant, pine-tar, 5-gallon-can

- Dubbing, 2-ounce-can
- Forges, portable, blacksmith, type 2
- Funnel, tin, 1-quart
- Glassware, tumbler, water
- Gloves, lantern, gas
- Grater—
  - Nutmeg, tin, 5-inch
  - Vegetable
- Grates, wood-burning
- Griddle, cast-iron, 20- by 30-inch.
- Grinders, brake, power-operated, diameter of wheel, 6 inches
- Grindstone, nonglaze
- Hammers, claw, carpenter's, 1-pound
- Handle—
  - Ax, single-bit, 36-inch
  - Broom, push, rattan, 51-inch
  - Hammer, 16-inch, blacksmith's
  - Hammer, claw, 14-inch, carpenter's
  - Hatchet, claw, 14-inch
  - Mop, spring, lever
  - Pick, 36-inch
  - Rake, garden, 66-inch
  - Shovel, 30-inch, D-grip
  - Sledge, 36-inch
- Hatchets—
  - Broad or bench, 5½-inch
  - Claw, with 4-inch cutting edge
- Hooks—
  - Box, 10-inch length
  - Brush, handled, 11½-inch
  - Grass, curved-bladed
  - Hay
- Irons, clinching
- Knife, round, 5-inch, saddler's
- Ladder, step, 8-foot
- Ladles—
  - 3¾-inch bowl diameter
  - 6-inch bowl diameter
- Lanterns, kerosene

Locks, pad, brass, 1½- by 2-inch  
 Mallet, round, 3½- by 5½-inch, carpenter's  
 Mashers, potato, 3⅝- by 18-inch  
 Mattock, handled—  
     Cutter type 2  
     Pick type 2  
 Measure, tin-lipped—  
     4-quart  
     2-quart  
     1-quart  
     ½-quart  
 Mops, cotton, without handle  
 Mover, car  
 Oil, neat's foot  
 Pans—  
     Baking and roasting, 3- by 12- by 24-inch (12  
         rations)  
     Baking and roasting, aluminum, with cover  
     Dust, hood pattern, 12-inch  
     Fry, diameter, 11 inches  
     Bake, tin  
 Picks, R. R., handled, 6- to 7-pound  
 Pipe, stove, 4- by 24-inch  
 Pitcher, water, 5½-quart  
 Plate—  
     Cook-pot, splash, for 15 gallons  
     Dinner, 9⅝-inch-diameter  
     Soup, 9-inch-diameter  
 Platter, meat  
 Pliers—  
     Slip-joint, combination, wire-cutting type, 6-inch  
     Side-cut, length 8 inches  
 Pokers, stove, 20-inch  
 Polishes, metal, liquid  
 Pot—  
     Cook, aluminum, 15-gallon  
     Marking, tin  
     Mustard, unhandled  
     Stock, 10-gallon, with cover  
     Stock, 15-gallon, with cover

Puller, nail, 18-inch  
Rake—  
    Fire  
    Garden, steel, 14-tooth  
Rolls, commissary  
Safe—  
    Field, key-lock  
    Office, key-lock (large, medium, or small)  
Saucer, coffee, 7-inch-diameter  
Scales, platform, 2,000-pound  
Scoop, flour or sugar  
Scrapers, dough, 6-inch  
Screwdriver  
Scythes—  
    Bush  
    Grass  
    Weed  
Shaker—  
    Pepper  
    Salt  
Shears, straight-cut, type A, tinner's  
Shovels—  
    D-handled, square-point, No. 2  
    D-handled, round-point, No. 2  
    Long-handled, round-point, No. 2  
Skimmers, 5- by 15-inch  
Sledges, double-faced, 6- to 8-pound, blacksmith's  
Spades, garden, square-point, D-handled  
Stoves, tent—  
    M1941  
    Sibley  
Table—  
    Camp, folding  
    Mess  
    Office, wood  
Tetrachloride, carbon  
Tray, mess, 6 compartments  
Truck—  
    Barrel, warehouse, 2-wheeled  
    Barrel, warehouse, 4-wheeled

**Truck—Continued**

Platform, warehouse, 1-ton

Tub, foot, rubber

Vises, pipe, capacity  $\frac{1}{8}$  to  $2\frac{1}{2}$  inches

Washers, plate, iron or steel,  $\frac{5}{8}$ - by  $1\frac{3}{4}$ - by  $1\frac{1}{16}$ -inch

Wedges, steel, woodchopper's

Wheelbarrow, wood frame and steel tray, 4-cubic foot

Wrenches, pipe

## 18. TENTAGE

Type of tent	Size			Number of men accommodated	Weight (pounds)*		Bulk in storage (cubic feet)*		Comments
	Floor dimensions	Height of ridge	Height of side wall		Tent only	Pins and poles	Tent only	Pins and poles	
Tent, squad, M1942.	16' x 32'	12' -----	4' 6"; door; 6' 2"	12	255	147	10.9	5.9	The M1942 squad tent is the basic tent of the Army. It was developed to replace all other medium-sized tents, including pyramidal, storage, and wall (large). It is also a partial replacement for the hospital ward tent, being used in medical units having less than 500 beds. It has twice the floor space of the pyramidal tent and can accommodate 12 men and their individual equipment comfortably.
Tent, squad, M1945.	16' x 32'	12' -----	4' 6"; door; 6' 2"	12	275	150	11.1	6.1	This tent supersedes the M1942 squad tent. It is similar in appearance but represents a new principle in design. Framework of webbing carries the strain normally carried by the canvas. The canvas in the tent is supported by the webbing and will outlast the canvas in previous tents.

Fly, tent, squad.	20' x 37' 7½"	12'-----	5' 3'-----	190	62	4.25	5	This tent was developed for use with the squad tent when used for hospital purposes as a means of controlling interior temperature in the tent. Limitations on supply of duck have prevented consideration of its issue for general personnel purposes.
Tent, pyramidal.	16' x 16'	12'-----	4' 6'-----	130	94	6.2	3.6	Prior to standardization of the squad tent, the pyramidal tent was the basic tent of the Army as well as the Navy. The design antedates the last war. In addition to its inefficient use of material, this tent places a greater strain on canvas than the squad tent due to the concentration of the entire structural strain in a small area of the tent at the peak.
Tent, wall (small).	8' 10" x 9' 2"	8' 6"-----	3' 9"-----	55	63	3.4	4.1	This tent is issued chiefly for officers' quarters in the field. It represents an inefficient use of canvas because of the small number of men accommodated for a given yardage.
Fly tent, wall (small).	15' 6" x 9' 2½"	-----	-----	23	15	3.1	7	Under some circumstances, this tent fly may be erected as a temporary shelter where side walls and ends are not required.

\*See footnote at end of table.

Type of tent	Size			Number of men accommodated		Weight (pounds)*		Bulk in storage (cubic feet)*		Comments
	Floor dimensions	Height of ridge	Height of side wall			Tent only	Pins and poles	Tent only	Pins and poles	
Tent, pyramidal (light-weight).	11' (dia.).	8' 6" -----	2' -----	4-6		37	2	2.5	.2	This tent is a man-portable shelter for mountain troops or for use in terrain where absence of roads prevents vehicle transportation.
Tent, sectional, hospital.	18' x 54'	12' -----	6' -----	24		771	327	31.5	12.2	This is an improved hospital ward tent, with an interior liner for temperature control, insect netting side walls, blackout vestibule entrances, high side walls to permit maximum use of interior floor space, and inside aisles for litter passage. It is sectional in construction to permit extension to any desired length.
Tent, ward, hospital.	16' x 50'	12' -----	4' 6" -----	20		390	259	20.5	9.6	This tent is similar in construction to the squad tent, as originally standardized, but 50 feet in length.

Fly, tent, ward, hospital.	20' x 54'	12'	5' 3"	193	225	101	7.6	4.5	This fly was developed for use with the hospital ward tent, as a means of controlling interior temperatures in the tent.
Tent, operating, (heavy).	18' x 54'	11' 1 1/4"	6'	-----	817	876	38.8	23.2	This tent, now replaced by the hospital sectional tent, was originally designed for operating purposes with a pole frame to eliminate center poles and leave the center area free for operating tables.
Tent, truck, surgical operating.	16' x 27'	12'	7'	6	252	75	10.3	3.5	This tent was designed to provide extra floor area for medical units provided with a surgical operating truck. Provided with a canvas floor and a tent liner, it can stand by itself if truck has to pull away from the tent in an emergency.
Tent, command post, M1942.	7' x 11' 10 1/2"	7'	6'	2	112	104	5	3.71	This tent was designed as a blackout tent, with high side walls to permit maximum utilization of interior floor space. It has a blackout vestibule entrance and a mail pouch, which allows messages to be received and sent without the messenger entering the tent.

\*See footnote at end of table.

Type of tent	Size			Number of men accommodated		Weight (pounds)*		Bulk in storage (cubic feet)*		Comments
	Floor dimensions	Height of ridge	Height of side wall			Tent only	Pins and poles	Tent only	Pins and poles	
Tent, command post, M1945.	10' x 13'	9' .....	6' .....	3		165	92	6.3	3.55	This tent supersedes command post tent. It has insect netting side walls and is equipped with a liner to insulate the tent against heat and cold. A stovepipe outlet is provided, which the old tent did not have. A new design blackout door permits easy entrance and exit of litter bearers when the tent is used for first-aid stations.
Tent, shelter, main-tenance.	18' 2" x 26' 2½"	13' 7 ¾"	5' 6" --	-----		499	Frame 755	26.3	58.0	This tent, which has a metal frame, thereby omitting interior poles and permitting entrance of the vehicle, is used as a shelter for repair of tanks and other heavy vehicles under cold climate conditions where it is not possible to make repairs in the open. A zipper-closed opening in the roof allows the removal of the vehicle engine by a crane on the outside of the tent. The tent is provided with

Tent, wall (large).	14' 6" x 14'.	11'-----	4' 6"-----	8	130	233	5.8	3.1	ground cloths for floor men working under vehicles.
Fly, tent, wall (large).	21' 6" x 14' 3".	-----	-----	.	50	13	1.6	.7	This tent is used chiefly by staff units concerned with supply and maintenance functions, as well as by pack medical units.
Tent, storage.	17' 10" x 20' 1".	13'-----	5' 3"-----	-----	200	202	9.6	9.2	This fly is used for field kitchens in addition to its original use with large wall tent.
Fly, tent, storage.	25' x 20' 5".	-----	-----	-----	85	20	2.8	.8	This tent is a large wall-type tent, originally intended for field warehouse purposes. It has high side walls and is equipped with a fly.
Tent, assembly.	40' x 80'.	21'-----	8'-----	80	1100	655	23.3	16.9	This tent, whose principal issue is one per organization with chaplain attached, is so designed that when used as an assembly tent it can accommodate approximately 450 men. It is designed in sections which lash together with lacing lines. The side walls also are in separate sections and may be rolled up or removed when weather conditions permit.

\*These figures are approximate averages. Due to variations in the quality of the fabric and in the amount of finish added, as well as in the types of material used in pins and poles, considerable variation will occur in actual measurements.

## 19. QUARTERMASTER SPECIAL PURPOSE VEHICLES AND EQUIPMENT

Name	Weight	Shipping dimensions					Remarks
		Length (in.)	Width (in.)	Height (in.)	Cu. ft.	Sq. ft.	
Mixing outfit, dry whole milk -----	915	96 3/4	43 1/16	38	125	32	The equipment consists of a portable electric mixer which is attached to the milk can, an electric cooler, 8 10-gallon milk cans, a strainer, and a stirrer. The mixer operates at only one speed. 160 gallons of milk are the daily capacity of the outfit.
Bath-unit, field, mobile 12-show- erhead.							
Bath-unit, field, mobile, 24-show- erhead.	3,800	105	72	57			The equipment consists of a boiler with a hinged water back for pre-heating the water, mounted on a two-wheel trailer. A landing wheel is at the front center of the trailer. There is a continuous flow of water at desired temperature at the rate of 1.8 to 2 gallons per minute from each of 24 shower heads.

Chamber, fumigation, methylbromide, nonportable.	4,000	151	85	101		The equipment consists of chamber, non assembly, counter-balance assembly, fan assembly, motor, the injector unit, and the truck assembly. Chamber is designed to withstand and maintain a pressure of 1 lb. per sq. in. 3 lbs. methyl bromide is capable of fumigating 330 cubic feet in 30 minutes.
Chamber, fumigation, methylbromide, portable, gasoline operated.		112	77	74	330	The equipment consists of six panels which form a boxlike chamber, the injector unit, fan assembly, and the engine. The chamber capacity is the fumigation of 75 to 90 barrels bags of loosely packed clothing, blankets, or other materials in 330 cubic feet of space in about 30 minutes.
Ice cream plant, portable, 2½-40 gallon.	1,880	79	36	56		The equipment consists of the freezer head, control box, electric motor, heat exchanger strainer and dehydrator, liquid receiver, compressor, storage batteries, fan, condenser, and gasoline engine. The refrigerator will make 2½ gallons of ice cream at one time. Up to 40 gallons can be hardened and stored.

Name	Weight	Shipping dimensions					Remarks
		Length (in.)	Width (in.)	Height (in.)	Cu. ft.	Sq. ft.	
Laundry, mobile, two-trailer type.							The equipment consists of 2 separate skids and a generator set. The washer skid includes the washer, extractor, and hot water heater. The tumbler skid contains the tumbler, air heater tools and the fire extinguisher. Equipment also includes supply hose, drain hose, suction hose, smoke stacks, tumbler exhaust duct, and water pump. The capacity is approximately 50 lbs. of clothes processed per hour. Capacity of washer is approximately 20 lbs.; extractor, 10 lbs.; heater, 36 gallons; tumbler 20 or 30 lbs., depending on model.
Laundry, portable, skidmounted, small-detachment.	418	27½	26	32	11		
Refrigerator, portable, chest-type (25 cubic feet).	3,600	94	38	57			Main parts of refrigeration system are: compressor, compressor shut-off valves, condenser, liquid receiver, dehydrator, filter, heat

exchanger, expansion valve, evaporator plates, pressure control, and thermometer. The net interior volume is 25 cubic feet. The refrigerator is designed primarily for limited storage of frozen foods—for which temperature is held at 10° F. For chilled foods, it is held at 40° F. It is operated by a hand-start gasoline engine and can be operated in transit. Refrigerator may be mounted in a 1 ton cargo trailer or two refrigerators on a 2½ ton truck.

The equipment consists of single needle sewing machine, darning machine, hand tack button machine, portable generator, battery, bobbins, machine attachments, lamps, needles, pins, tent, timbles, yardsticks, etc. Motive power for the trailer is supplied by a 4-5 ton, 4 x 4 tractor-truck, which is attached to trailer by a fifth wheel. The semitrailer has a payload of six tons. When stationary,

Refrigerator, portable, walk-in, self-contained (150 cubic feet).

Semitrailer, 2-wheel, van-type, clothing repair.

Name	Weight	Shipping dimensions					Remarks
		Length (in.)	Width (in.)	Height (in.)	Cu. ft.	Sq. ft.	
Semitrailer, 2-wheel, van-type, laundry.	20,000	209	96	132			<p>the trailer is supported by two dolly wheels and jacks at both forward corners. Exterior width is 7½ feet; interior length is 20 feet. There is a door at each end of the trailer and three windows on each side.</p> <p>The equipment consists of a washer, extractor, drying tumblers, hot water heater, boiler, electric generator, cold water pump, hose, fuel tanks, etc. Motive power for the trailer is supplied by a 4-5 ton, 4 x 4 tractor truck, which is attached to trailer by a fifth wheel. The landing gear consists of two leg members to which are attached two dolly wheels. Jacks provide a means of leveling the van. The production rate for a section (2 laundry trailers) is 250 pounds an hour.</p>

Semitrailer, 2-wheel, van-type, repair, textile.	20, 500	270	96	132	<p>The equipment consists of overedging machine, single needle sewing machine, single needle darning machine, single needle machine, portable button machine, portable generator, battery, bobbins, lamps, needles, pins, setting die for grommets, tent, thimbles, yardsticks, etc. Motive power for the trailer is supplied by a 4-5 ton, 4 x 4 tractor-truck, which is attached to trailer by a fifth wheel. The semitrailer has a pay load of six tons. When stationary, the trailer is supported by two dolly wheels and jacks at both forward corners. Interior width is 7½ feet; interior length is 20 feet. There is a door at each end of the trailer and three windows on each side.</p>
Semitrailer, 2-wheel, van-type, shoe-repair.	20, 400	270	95½	131	<p>The equipment consists of finishing machine, shoe patching machine, sole cutter and skiver machine, stitching machine, generating set, awl blades, awl haptors, hammers, knives, nippers, pullers, pliers, rasps, nail sets, eyelet and heel removers, shears, work tables, etc. Motive power for the trailer is supplied by a 4-5 ton, 4 x 4 tractor-</p>

## SECTION V

### PETROLEUM

#### 20. PETROLEUM PRODUCTS COMMONLY USED IN THEATERS OF OPERATION

A tabulation of all standardized fuels and lubricants that have been approved for procurement and use in army equipment other than aircraft operated by the United States Air Force may be found in SB 38-5-3. The following tabular statement, adapted from that bulletin, provides information on the fuels and lubricants commonly used in theaters of operation:

Product	General use	Symbol
<b>LIQUID FUELS</b>		
<i>1. Gasoline.</i>		
Motor fuel (all-purpose), 80-octane USA 2-103C	For all oversea motor vehicles.	80
Gasoline (unleaded and undyed), 65-octane USA 2-116A	For oversea use in gasoline stoves, gasoline lanterns, etc.	65
<i>2. Burning oils.</i>		
Kerosene FS VV-K-211A	For lanterns and stoves designed to operate on kerosene.	K
<i>3. Fuel oils.</i>		
Oil, fuel, Diesel, 40-octane USA 2-102E	Fuel for Diesel engines (also heating).	D A
Oil, fuel, Diesel, 50-octane NS 7-0-2E	Fuels for high speed Diesel engines.	D A

Product	General use	Symbol
<b>LUBRICATING OILS</b>		
<i>1. Engine oils.</i>		
Oil, engine (SAE 10) USA 2-104B	For lubrication of internal combustion engines, etc.	OE 10
Oil, engine (SAE 30) USA 2-104B	do.....	OE 30
Oil, engine (SAE 50) USA 2-104B	do.....	OE 50
<i>2. Gear lubricants.</i>		
Lubricants, gear, universal (SAE 75) USA 2-105B	For lubrication of all automotive gear units as prescribed (temperature below 0°F.).	GO 75
Lubricants, gear, universal (SAE 90) USA 2-105B	do.....	GO 90
<b>GREASES</b>		
<i>1. Grease, general-purpose, No. 0.</i>		
USA 2-106	For lubrication of vehicle chassis and other equipment where specified (temperature below 32°F.).	CG 0
<i>2. Grease, automotive and industrial.</i>		
FS VV-G-632 Type A, Grade I	Lubrication of vehicle chassis and other equipment where specified (temperature above 32°F.).	CG 1
<i>3. Grease, general-purpose, No. 2.</i>		
USA 2-108B	Wheel bearings and other equipment as specified.	WB
<i>4. Grease, automotive, and industrial.</i>		
FS VV-G-632 Type A, Grade 4	Water-pump bearings and other points as specified.	WP

## 21. CONVERSION TABLE, OIL GASOLINE AND GREASE

From—	To—	Conversion factor
Oil, gallons.....	Pounds.....	7.5
Oil, in drums (short tons)	Measurement tons.....	.83

## 22. GASOLINE EQUIVALENTS

Quantity	Per gallon	Per barrel	Per drum	Per pound	Per short ton
Gallons	-----	42	53	0.1626	325.2
Barrels	0.02381	-----	1.31	.00387	7.7429
Drums	.01818	.76374	-----	.002956	5.9127
Pounds	6.15	258.3	338.25*	-----	2000
Tons	.003075	.12915*	.16913	.0005	-----

\*Does not include weight of container.

## 23. ESTIMATE OF REQUIREMENTS

Methods of computation are as follows:

*a. Per man per day method.*

- (1) The per man per day method of computation is used in the early planning stages when definite information is not available on the number and types of vehicles. It is to be used as a guide only and not as a substitute for a more exact computation. Since the figures derived from this method vary with the situation, no established maintenance factors can be used that may apply to all types of operations.
- (2) The following table, which is the estimated average daily expenditure of the class III supplies (except Polar theater of operations) may be used as an over-all basis for considering the requirements of ground, air, and service operations:

Item—class III	Pounds per man per day	Tons per man per day	Conversion factors short to measurement tons	Measurement tons per man per month	Measurement tons per man per month with 15 percent stowage
Gas, oil, grease (less AF).	11.4	0.174	1.5	0.261	.300
AF fuel and lubricants.	12.0	.179	1.5	.269	.309
Subtotal	23.4	.353	-----	.530	.609
Less 90 percent assumed shipped by tanker.	21.06	.318	-----	.477	.548
Shipped as dry cargo.	2.34	.035	-----	.053	.061
Fuel for temperate zone.	8.50	.128	2.0	.256	.294
Total class III.	31.90	.478	-----	.786	.903

*b. Per vehicle per day method.* In deciding upon the POL requirements for a specific operation, it is necessary to know the number and types of vehicles and organizations. It is necessary also to know the average consumption rate per mile and the average operating mileage per day.

*c. Unit method.* The unit method, which is more or less a combination of the per man per day and the per vehicle per day method, is based primarily on the units involved, the estimated movement, and the location of dumps, together with the quantity of supplies at the dumps.

## 24. FACTORS CONTROLLING GASOLINE REQUIREMENTS

The main factors controlling the gasoline requirements of motor vehicles in military operations are—

*a. Distance of movement.* By measuring the distance the center of an organization is displaced, one can find how many miles each vehicle in an organization will have to move.

*b. Gallons of fuel per mile.* The number of gallons of gasoline required to move the vehicles a given distance will have to be known. (If no estimates are available, an estimate of 6 gallons per wheeled vehicle per day and 50 gallons per track-laying vehicle per day can be used.)

*c. Distance of supply point.* Under certain conditions, certain vehicles will have to go to supply points. In this event, requirements for average round-trip distances must be used. Since only 2/10 of the vehicles will make this trip, the estimated requirements of the supply vehicles may be obtained by multiplying the distance moved by the organization by the number of gallons required to move the organization and taking 2/10 of the result.

*d. Variables.* Consideration must also be given to fuel needs for warming up engines, and for movement within the bivouac areas and on reconnaissance. Under average conditions, gasoline sufficient to move every vehicle in the organization 10 miles will be required for these variables.

*e. Other factors.*

- (1) In the combat zone, 10 percent should be added to consumption figures obtained from gasoline supply data tables in order to de-

termine the gross requirements. This addition covers evaporation, spillage, and small combat losses in the forward area.

- (2) Vehicles used in amphibious assault operations are combat-loaded aboard ships and craft, with fuel tanks  $\frac{3}{4}$  full, and carry 10 gallons of reserve fuel in 5-gallon expeditionary containers. An additional supply is generally combat-loaded in the assault convoy and in the supply convoy.

## 25. USE OF EXPERIENCE TABLES

*a.* Performance figures from experience tables are useful in determining class III requirements. Weekly requirements can be calculated by such figures and by maintaining close liaison with G-3. Estimates for each succeeding week are prepared for the requisite amounts. An allowance for 5-percent increase in tonnage is generally made for auxiliary equipment, such as ranges and generators. Allowances for lubricants can be made on a percentage basis established from experience.

*b.* When the gallons per mile (unit mile) required for any specific vehicle are known, it is possible to compute the requirements for operations in progress or projected. For example, a 7-day supply may be computed in the following manner:

Vehicles		Unit mile	Gasoline requirements (gallons)	
No.	Type		1 day (50 miles)	7 days
4	Light tank M24.....	0.63	0.63 x 4 x 50—126	882
2	Medium tank M4A4.....	1.25	1.25 x 2 x 50—125	875
6	Half track.....	.30	0.30 x 6 x 50—90	630
8	¼-ton.....	.069	0.069 x 8 x 50—27.6	193.2
5	2½-ton.....	.212	0.212 x 5 x 50—53	371

c. A specific table can be developed from any performance record. An example of such a table is the following:

Number of vehicles	Consumption per veh. per day	Total consump- tion per day	Total quantity on hand	Days of supply
-----------------------	---------------------------------	--------------------------------	---------------------------	-------------------

- (1) Column 4 divided by column 3 gives column 5.
- (2) Column 3 divided by column 1 gives column 2.

## 26. CLASS III REQUIREMENTS FOR AMPHIBIOUS OPERATION

The following methods of arriving at class III requirements and making storage computations are taken from quartermaster reports of an amphibious operation in Europe. The computations may serve to illustrate the principles of estimates discussed in paragraph 25.

Type of vehicle	Miles per gallons	Type of gas	No. of vehicles	Gallons per 100-mile day	10-day supply (gal.)
Tank type	1	V80-octane	1,629	162,900	1,629,000
Half track	3	-----do-----	1,580	52,700	527,000
Auto units	8	-----do-----	27,270	340,875	3,408,750
					5,564,750

(1)

Number of 5-gallon cans of gasoline -----	1,112,950
Total weight (40 lb. per can) of gasoline -----	44,518,000
Number of long tons of gasoline -----	19,428

(2)

Lubricating oil (5 percent of fuel requirements in gallons) -----	278,238
Gear lubricant (7 percent to 10 percent of fuel requirements in gallons) -----	556,475
Number of 5-gallon cans of lubricating oil and gear lubricant -----	166,943
Weight of same at 45 pounds per can -----	7,512,435
Grease (2 percent of requirements in gallons but expressed in pounds). -----	111,295
Total weight of lubricating oil, gear lubricant, and grease -----	7,623,730
Number of long tons of same -----	3,403

(3)

Total number of long tons of gasoline, lubricating oil, gear lubricant, and grease -----	22,831
--	--------

(4)

Number of cubic feet of shipping space (at 110 cubic feet per long ton) required for gasoline, lubricating oil, gear lubricant, and grease, including allowance for broken storage -----	2,511,423
--	-----------

(5)

Actual number of cubic feet (at 51 cubic feet per long ton) required for gasoline, lubricating oil and gear lubricant in 5-gallon cans ----- 1,164,381

(6)

Each motor vehicle will carry ashore a tank full of gasoline and enough gasoline in 5-gallon cans for 24 hours' operation.

(7)

Due to the necessity of having an adequate supply of gasoline and lubricants available for immediate use in the early stages of the operation, it would be essential, and most desirable, to transport, the gasoline and lubricants, equally divided, on at least three or more, preferably six, ships so that unloading could be carried on simultaneously at different docks and that, in the event of destruction of one or more ships, the remaining ships would deliver a supply of gasoline and lubricants for the initial operation.

## 27. SPACE REQUIREMENTS FOR A CLASS III DEPOT

The following plan, based on quartermaster reports of operations in Europe, may be considered in arranging the layout of a class III depot:

Type of vehicle	Miles per gallon	Type of gas	No. of vehicles	Gallons per 100-mile day	10-day supply (gal.)
Tank type	1	V80-octane	1,629	162,900	1,629,000
Half track	3	-----do-----	1,580	52,700	527,000
Auto units	8	-----do-----	27,270	340,875	3,408,750
					5,564,750

## (1)

Number of 5-gallon cans of gasoline .....	1,112,950
Number of stacks (100 cans per stack) of gasoline .....	11,130

## (2)

Lubricating oil (3 percent of fuel requirements in gallons) .....	166,942
Gear lubricant (1 percent of fuel requirements in gallons) .....	55,648
Grease (1 percent of fuel requirements in gallons but expressed in pounds) .....	55,648

*Note.* The type of engine oil to be stocked will depend on age of vehicles and on climatic conditions.

## (3)

Placing the stacks 40 yards apart for safety purposes will require 400 sq. yd. per stack in open storage. On this basis the following open storage space (sq. yd.) will be required.

(a) For gasoline .....	4,452,000
(b) For lubricating oil (3 percent fuel) .....	133,560
(c) For gear lubricant (1 percent fuel) .....	44,520
(d) For grease (1 percent fuel) .....	44,520

---

4,674,600

## (4)

In arrangement of the stacks, advantage should be taken of all available natural camouflage, which might necessitate placing some stacks more than 40 yards apart. Inadequate natural camouflage would necessitate cutting brush or obtaining net or other camouflage from the Corps of Engineers.

## (5)

In the event of wide dispersion of large units, which railroads or road nets might make necessary or desirable, it might be desirable to establish two or more smaller depots instead of one large depot.

## 28. DIMENSIONS OF STANDARD POL CONTAINERS

Nomenclature	Units in package	Type of package	Size of package (inches)		
			L	W or Diam.	H
U. S. 55-gallon drum, 16 gage.	1	Drum	0	24 $\frac{1}{8}$	34 $\frac{3}{4}$
U. S. 55-gallon drum, 18 gage.	1	---do---	0	24 $\frac{5}{8}$	34 $\frac{7}{8}$
U.S. 5-gallon can (gasoline)	1	Can --	13 $\frac{3}{4}$	6 $\frac{1}{2}$	18 $\frac{3}{8}$
U. S. 5-gallon can (oil)-----	2	Case--	0	11 $\frac{15}{16}$	14 $\frac{3}{16}$
U. S. 5-quart can (oil)-----	6	---do---	22	14	10
U. S. 1-quart can (oil)-----	12	---do---	18	13	6
U.S. 25-pound pail (grease)	1	Pail --	0	11 $\frac{1}{2}$	11 $\frac{1}{2}$

## 29. WEIGHTS, VOLUMES, AND CONVERSION FACTORS

55-gal drums <sup>2</sup>		455	11.2	12	8.70	.115	280			40.7	45.5	40.0
5-gal drums <sup>2</sup>		49.2	.95	1	9.76	.103	205	200		58.0	64.9	40.0
1-qt cans (12 per case).		34.5	.88	1								
1-qt cans (24 per case).		60	1.6	2						33.4	37.3	20.0
5-qt cans (6 per case).		77	1.9	2						26.0	29.1	20.0
Greases.	Bulk:											
25-lb pails.		29	.95	1						69.0	77.2	40.0
5-lb cans (6 per case).		44	1.1	2						45.4	50.9	20.0

<sup>1</sup> For ocean shipping, storage, and pipeline computation, bulk petroleum products are usually measured in barrels of 42 gallons each, or in long tons.

<sup>2</sup> Drums, 55-gallon, are normally filled to 53 gallons to allow for expansion. Drums, 18-gage weight approximately 51 pounds empty.

<sup>3</sup> For planning purposes weight of gasoline may be taken as 42 pounds and weight of lubricating oil for motors as 50 pounds per 5-gallon drums, including weight of the drum. Drums, 5-gallon weigh approximately 11 pounds empty.

## 30. COLLAPSIBLE CONTAINERS

*a. General.* The collapsible containers or cells, which are made of synthetic-rubber impregnated fabric, are manufactured in the following types and capacities:

- (1) *Type 1.* Type 1 containers are nonrigid containers of 1,000- and 3,000-gallon capacity each. They are supported inside a canvas housing and rest on a canvas ground cloth.
- (2) *Type 2.* Type 2 containers are rigid containers of 750- and 2,700-gallon capacity each. They are supported inside a plywood housing and may be used for the storage and transportation of liquid fuels.

*b. Uses.* Collapsible containers are most useful when shipping space is limited and where short time storage is anticipated. They may be set up singly or connected in banks to a central or main line. The 750-gallon containers, when erected and filled, may be transported on a 2½-ton truck. Three 2,700-gallon containers may be placed lengthwise on a flatcar used to transport petroleum products. The containers and accessories are packed by the manufacturer in plywood boxes. These boxes should be retained.

*c. Dimensions and other data.*

Gallonage	No. of cases	Dimensions of cases	Weight	Cubage
1.000---	1	$92\frac{1}{4} \times 32\frac{1}{4} \times 16\frac{1}{4}$ "--	400	28.0
3.000---	1	$142\frac{1}{4} \times 47\frac{1}{4} \times 12\frac{1}{4}$ "--	751	47.6

	Total 6	-----	2,740	187.49

### 31. STORAGE TANKS

*a. General.* Storage at terminals or loading locations normally will be in bolted steel tanks ranging in capacity from 100 to 10,000 barrels (42 U. S. gallons equal 1 barrel). Pressure and vacuum-release valves are supplied with all sizes of tanks.

*b. Capacities and other data.*

Type of tank	Gallons	Barrels	Weight (pounds, empty)	Cubic feet (packed)
Steel, bolted	420,000	10,000	74,000	2,015
Do	210,000	5,000	43,000	890
Do	42,000	1,000	12,795	292
Do	21,000	500	7,360	218
Do	10,500	250	4,900	144
Do	4,200	100	2,250	80

## 32. DISPENSERS

Dispensers are used for decanting gasoline, Diesel oil, and all other nonviscous POL products.

a. The 30-gallon-per-minute dispenser is a small portable unit mounted on a tubular frame and weighs approximately 300 pounds. It can be transported in either a cargo vehicle or a trailer or can be carried by two men. The suction hose is 30 feet long. It has one 20-foot length of discharge hose equipped with a Y-coupling providing two 10-foot lengths, each equipped with a nozzle.

b. The 100-gallon-per-minute dispenser is skid-mounted, weighs about 2,000 pounds, and is usually carried on a 1-ton trailer. It has four 25-foot lengths of suction hose and four 75-foot lengths of discharge hose, each equipped with Y-couplings providing two 10-foot lengths, each equipped with a nozzle.

### 33. TRANSPORTATION, RAIL AND MOTOR

#### *a. Rail.*

- (1) Tank cars, when available, are used to move petroleum. The cars are metal cylindrical tanks varying in capacity from 6,000 to 13,000 gallons. They have a manhole through which they are loaded and an outlet valve through which they are unloaded. Tank cars used for shipping one kind of petroleum products should be thoroughly cleaned before they are used for another kind. The U. S. Army 40-ton tank car has a nominal capacity of 9,900 U. S. gallons. The safety valves are set at 25 pounds per square inch.
- (2) The dimensions of an average U. S. railway boxcar are 50 feet long, 10 feet high, and 8 feet wide. Its average capacity is 50 short tons and it can transport 1,700 filled or 3,200 empty 5-gallon containers, 175 filled or 300 empty 55-gallon drums.

#### *b. Motor.*

- (1) *General.* There are various types and sizes of tank trucks and trailers used to transport petroleum products. Among those most widely used are the 750-gallon truck and the 2,000-gallon semi-trailer. Skid tanks of 750-gallon capacity may also be used. Two of these can be mounted on a 1-foot-bed, cargo-body, 2½-ton 6 x 6 truck to provide a 1,500 gallon carrying capacity.

(2) *Standard types and capacities of trucks and trailers.*

Type of container	Unit pack	Cases or units per load*			
		1-ton trailer (capacity)	2½-ton cargo (capacity)	5-ton cargo (average)	10-ton semitrailer (average)
<i>Full</i>					
U. S. 55-gallon drum.	1	6	15	24	49
U. S. 5-gallon can (gasoline).	1	50	125	250	500
U. S. 1-quart can (oil).	12	60	145	290	581
U. S. 25-pound pail (grease).	1	70	170	245	690
<i>Empty</i>					
U. S. 55-gallon drum.	1	6	23	23	55
U. S. 5-gallon can (gasoline).	1	88	320	320	750

\* When overloads are authorized, these quantities may be increased to the cubic capacity of the vehicles or to 100 percent overload, whichever limit is reached first.

### 34. PIPE LINES

Portable military pipe lines are a rapid and comparatively safe method of moving large quantities of petroleum over rough terrain. They relieve congested road traffic and are quickly installed. The 4-inch pipe line has a capacity of 200 barrels (or 8,400 gallons) an hour; the 6-inch has a capacity of 400 barrels (or 16,800 gallons) an hour. The lines come in standard 20-foot sections. One of these

sections, equipped with pressure reducers and attachments for hose, may be used as an outlet to form emergency filling stations for vehicles. Pipe lines may be used for—

*a.* Transportation of petroleum over terrain too rugged for other means of transportation.

*b.* Relief of congestion where road capacity is limited.

*c.* Rapid transportation of petroleum over long distances.

*d.* Transportation of petroleum over short distances where enemy action makes other means of transportation impracticable.

### 35. AIR

Petroleum products may be transported by air. See section IX, paragraph 61.

## SECTION VI

### WAREHOUSING

---

#### 36. SPACE LAYOUT

In the determination of space layout for a storage area, both commodity and capacity factors will be taken into account.

*a. Commodity factors.* Commodity factors concern the supplies themselves. Active supplies must be stored near doors and loading points. Supplies in quantity should have large blocks of space provided in center or end bays, where maximum stacking height may be obtained. Small quantities may be placed in different parts of the storage area. The size, weight, and shape of the supplies must be considered in space planning so that heavy or bulky items will have a shorter distance to travel between stock and loading point than supplies that are light and easy to handle. Space should be planned in such a way that supplies which need special consideration may be given proper storage.

*b. Capacity factors.* Capacity factors concern the storage area itself—its physical characteristics and the use of floor or ground area and space from there upward. Space will be planned so that every foot of floor or ground space may be utilized. Vertical storage space is just as valuable as an equal amount of horizontal space. It is wasted when supplies are not stacked high.

## 37. AISLES ARRANGEMENT

*a. General.* A warehouse aisle is a passageway along which supplies and materials-handling equipment may be moved. Whenever possible, aisles should be laid out with reference to the location of doors. There are two primary types of warehouse aisles:

- (1) *Transportation aisles.* Transportation aisles provide access to the loading platform and to the supplies in storage. They also provide for traffic and operation of equipment. They should run in the direction of the heaviest traffic, and a sufficient number of them should be used so that no other aisles will be necessary. There are two types of transportation aisles:
  - (a) *Main aisles.* Main aisles should be wide enough to permit easy passing of two loaded pieces of materials-handling equipment going in opposite direction. Main aisles of 10-foot width, accommodating a 4,000-pound-capacity fork lift truck, are ample for the average warehouse.
  - (b) *Cross aisles.* Cross aisles run at right angles to the main aisles, which they connect. Wherever possible, they should lead directly to the loading platforms. They should be 9 to 10 feet wide and should be laid out so that there will be a 30- to 45-foot depth of storage.
- (2) *Fire aisles.* Fire aisles will be arranged in accordance with Department of the Army

directives pertaining to fire regulations. They should not be obstructed. Portable fire-fighting equipment should be placed in readily accessible locations, beside doors and columns at transportation aisles, and at fire wall entrances.

*b. Planning aisle arrangements.* In planning aisle arrangement consider the following:

- (1) Location of loading and unloading platforms.
- (2) Arrangement of posts or columns for floor or roof support.
- (3) Size and types of materials-handling equipment.
- (4) Methods of storage.
- (5) Light facilities.
- (6) Dimensions and weights of supplies.

## 38. SPACE REQUIREMENTS

*a. Closed storage.*

- (1) An ideal closed-in warehouse is used as the basis for computing the number of square feet required for storing quartermaster supplies. From this ideal number allowances can be made for storage in buildings not designed as warehouses, for storage in the open, and so on. Factors to be used in computing ideal storage space are—
  - (a) Weights and cubic measurements of all T/E and T/O & E items of equipment required for a model stock.
  - (b) Amount of net space required for storage of supplies.

- (c) Amount of space consumed by aisles; fire aisles; obstructions, such as posts and unusable corners in the warehouse; sorting space, etc.
- (d) Floor load capacity and height of stacks based on floor load or handling equipment.
- (2) The net space required to store all items of a model stock for a given number of men is computed and reduced to the number of pounds per man per day for each class or group of items. From this per man figure storage requirements for any number of men can be computed.
- (3) The average net usable space in any warehouse may be estimated roughly as 60 percent of the total gross space. This leaves roughly 24 percent for aisles, lost space, etc. and an additional 16 percent as a safety factor. Note that this statement is consistent with the requirement that, to get the gross space needed, 40 percent should be added to the net square feet of storage space required. In this latter rule the added safety factor is not present.

*b. Open storage.*

- (1) *General.* The principal factors involved in computation of open storage space are dispersion and the use of tentage, paulins, or dunnage.
- (2) *Dispersion.*
  - (a) *Ratio of storage to dispersion.* The ratio of storage space to dispersion space is 1 to 40, subject to the following con-

ditions: nature of the supplies, danger of enemy attack, terrain, and the effect of dispersion on the efficiency of dump operations. Thus, 1 square foot of gross storage space usually requires 40 square feet of dispersion space.

- (b) *Dispersion acreage.* Since the approximate number of square feet per acre is 40,000, the dispersion acreage may be obtained by multiplying the number of square feet of gross storage space by 40 and dividing the product by 40,000. (The same result may be obtained more readily by simply dividing the number of square feet of gross storage space by 1,000.).

c. *Storage space requirements.* The following will serve as a guide for computing the storage space required to maintain any given number of men:

*Gross Storage Requirements\* (Square Feet)  
in Theater of Operations*

Class	Per man per day			
	Closed	Open	Refrig.	Total
A ration.....	0.0556	0.0415	0.0264	0.1235
C & E.....	.0146	.0019	0	.0165
Regular supplies.....	.0014	.0007	0	.0021
B ration.....	.0329	.0493	0	.0822
C-2, C-3, and C-4 ration.....	0	.0298	0	.0298
5-in-1 ration (A or B).....	0	.0274	0	.0274
Individual assault food packet.....	0	.0085	0	.0085

\* Requirements are based on experience in the European theater of operations and allow for 8 feet stacks and 40 percent unusable space. Requirements do not include the dispersion factor for setting up storage tents in open fields.

### 39. DETERMINING SQUARE FOOT ALLOCATION

To determine the number of square feet of floor space required to store 1 ton, divide the weight in pounds per ton by the allowable floor load. To determine the total number of square feet required, multiply the number of tons of supplies to be stored by the square feet per ton. For example, assume that the floor load allowed per long ton of supplies is 250 pounds per square foot. Then the approximate net storage space required per ton is 9 square feet ( $2,240 \div 250$ ). The total number of square feet of storage space for 40 tons (assumed) would be 360 ( $40 \times 9$ ).

### 40 DETERMINING MAXIMUM STACKING HEIGHT

Assume that certain supplies (40 tons) consist of 50-pound boxes and that each box occupies 3.5 square feet of floor space, 250 pounds per square foot being the allowable floor load. Then the load per square foot is approximately 14 pounds ( $50 \div 3.5$ ). the approximate number of boxes to be stored in one column would be 17 ( $250 \div 14.3$ ).

### 41. FLOOR LOADING

a. Safe warehouse floor loads are normally determined by reference to the building plans on which the floor capacities in pounds per square foot are usually designated. In all cases where building plans are not available or where the plans do not indicate safe floor loads, or where the accuracy of the stated floor loads is doubtful, a competent en-

gineer must be brought in to establish floor load capacity.

b. Loading on floors should be distributed so that the weight bearing on any single square foot does not exceed the load capacity of that square foot. Thus, a warehouse bay defined by columns 16 feet apart, with a safe load capacity of 250 pounds per square foot, may be evenly loaded to a total of 64,000 pounds ( $16 \times 16 \times 250$ ).

c. In certain instances, overloading of portions of a floor area to compensate for adjacent vacant or underloaded portions is permissible and is recommended whenever space is at a premium. The following may be used as a guide to safe overloading:

- (1) In wood frame construction, where the normal storage space of a floor area is reduced by narrow aisles, the remaining storage space may be overloaded by an amount equal to the capacity of the aisles, provided that the aisle runs perpendicular to the floor support and that the excess load is uniformly distributed over the remaining portion of the bay. For example, a 16- by 16-foot bay whose safe floor capacity is 250 pounds per square foot can be loaded to a total of 64,000 pounds. A fire aisle 2 feet wide running the full length of the bay would reduce the storage space by 32 square feet, leaving a remaining area of 224 square feet for storage. Provided that this aisle runs perpendicular to the floor supports, the remaining area could safely be loaded at the uniform rate of 64,000 divided by 224 or approximately 285 pounds

per square foot. When the aisle runs parallel to the floor supports or is used for the transportation of supplies or the movement of mechanical equipment, compensation will not be made and the remaining space in the bay will not be loaded beyond the rated space capacity.

- (2) In wood frame construction, when a bay is to be loaded unequally, it can normally be stored to its full capacity, provided that no part is overloaded in excess of 20 percent and that the dividing line of the unequal loading is perpendicular to the floor support—that is to say, that the floor joists run out from the underloaded portion and through the overloaded portion. For example, a 16- by 16-foot bay with a total safe load capacity of 64,000 pounds may be loaded on the side of a line perpendicular to the floor joists with 38,400 pounds of supplies and on the other side with 25,600 pounds. If the dividing line of unequal loading runs parallel to the floor support, the maximum load per square foot may not exceed the rated safe load.
- (3) In reinforced concrete flat slab construction, where a portion of the floor is not loaded in order to provide aisle space or for other reasons, the remaining portion of the floor can sustain an overload, provided it does not exceed  $33\frac{1}{3}$  percent over any appreciable portion of the floor.

d. The maximum capacity of fork lift trucks

which may be safely operated on a warehouse floor of a given live load can be determined as follows:

- (1) Floors having a safe live load capacity of 250 pounds per square foot will in general support with safety the operation of loaded fork lift trucks whose capacity does not exceed 4,000 pounds. The floor space adjacent to aisles over which the trucks travel will not be loaded beyond its rated safety load and no other concentrated loads will be permitted in aisles when the trucks are operating.
- (2) Fork lift trucks exceeding 4,000-pound capacity will be divided into two classes in determining floor safety for their operation. First, trucks having close spacing of wheels or tricycle arrangement of wheels, or narrow-gage tracks with short wheelbase, require that each individual floor be analyzed to determine whether the trucks can operate safely. Second, trucks having a gage of 3 feet or greater and a wheelbase of 5 feet or greater may operate safely in reinforced concrete buildings or steel frame buildings with reinforced concrete floor slabs, on floors designed for 350 pounds per square foot or where the framing can support a concentrated load of 2,500 pounds distributed over an area 2.5 feet square.
- (3) An allowance for impact of 15 percent of the total truck load will be added in all computations for determining safe loads on floors.

## 42. TYPES AND SIZES OF PAULINS

*a. Canvas.* Canvas paulins are normally provided in two sizes—12 by 17 feet and 17 by 40 feet; however, various other sizes are in use. Consideration must be given to the sizes of paulins available before determining the size of the stacks to be made. Canvas paulins are much more convenient to use. Due to their strength they may be pulled over the stack without too great a hazard of tearing, and there is less possibility of their ripping and tearing loose because of wind. Canvas paulins are not expendable.

*b. Paper.* Brown-skin or paper paulins are most commonly procured in size 15 by 60 feet. Actually this size is made up of five 3- by 60-foot sections sewn together with overlapping seams. Various other sizes may be procured or cut by the using agency. Brown-skin or paper paulins have the advantage of being much lighter than other covers, but care must be taken to place them rather than pull them over the stack. Paper paulins require more care in lashing to eliminate the possibility of tearing by the wind. If the paper paulin is creped in one direction and crimped in the other, it will withstand long exposure without separation of the paper from the asphalt bond. The crepe in the paper takes up the shrinkage as the material weathers. Paper paulins are expendable and may be shipped with the item.

## 43. MATERIALS HANDLING EQUIPMENT

### *a. Fork lift trucks.*

#### *(1) General.*

##### *(a) Description.*

1. The fork lift trucks is a four-wheel automotive unit which enables one man to pick up a unit load, carry it to its destination, and stack it. The load is carried in front of the truck on a two-tined fork, which is moved vertically on a supporting frame by either a mechanical or hydraulic lift mechanism. The supporting frame and the fork can be tilted forward from the vertical to pick up the load and backward from the vertical to aid in balancing the lifted load. The weight of the load in front of the truck cannot exceed the amount of the vehicle's weight which falls behind the "center of driving" wheels.
2. Fork lift truck capacity is rated upon the weight of the load that can be carried and the height that the load can be lifted. For interior warehouse duty, the fork lift truck is commonly equipped with solid rubber tires. For outdoor use, pneumatic tires are provided to traverse uneven ground. Models used outdoors can be considerably larger and, therefore, have greater carrying capacities than those used indoors.

3. The fork lift truck may be powered by a gasoline engine, a battery-electric motor, or a gas-electric power unit. The brake system is either hydraulic or mechanical. Either automobile-type steering or lever-type steering may be found in the fork lift truck, but the automobile-type is the more common.

(b) *Use.*

1. The extreme flexibility of the fork lift truck is its primary advantage. The most successful and efficient use of the fork lift truck is in handling palletized unit loads of 2,000 pounds or more. However, it is often used to move items which, because of their size or shape, cannot be palletized.
2. In performing high unit-load storage, the fork lift truck utilizes maximum cubic space, simplifies inventories and inspections, and permits rapid relocation of supplies. To make the most of the versatility of the fork lift truck, it should be used in conjunction with a tractor-trailer train whenever the horizontal distance the load to be carried is 250 feet or more.
3. The use of gasoline or electric power in the fork lift truck depends upon the requirements of a particular storage situation. Relative advantages must be considered in choosing a truck for a specific job.

*b. Platform trucks.*

(1) *General.*

(a) *Description.*

1. The platform truck is a self-propelled, power-operated vehicle designed to lift, transport, and set down loads mounted on skids. The load platform is supported by the entire wheel base.
2. There are three types of platform trucks, with varying load capacities. The simplest type is a load carrier with a stationary platform. This truck cannot load itself, so it can be used only for transporting materials.
3. In the second type of platform truck, the platform may be raised slightly above its resting position. That elevation is sufficient to make this type self-loading when used with a skid.

4. The third, and most useful, type of platform truck is equipped with a high-lift platform. At rest, the platform is supported by the bed frame of the truck, but it can be raised high on vertical masts erected at the rear of the platform. This truck loads itself, transports the load, and lifts the load high enough to stack it in storage.
5. The platform truck may be powered by a gasoline engine, a battery-electric motor, or a gas-electric power unit. The braking system is usually mechanical, but hydraulic brakes appear occasionally in some of the larger models. Either automobile-type or lever-type steering may be used.

(b) *Use.*

1. The platform truck is used primarily to transport unit loads from one place to another, but it may be used for stacking. It is less expensive than the fork lift truck and more durable per pound of weight because all the wheels of the platform truck support the load.
2. However, the platform truck must be used with skids or platforms. Skids use up more vertical space than pallets, do not distribute weight evenly, and are more expensive. Furthermore, the platform truck is not as maneuverable as the fork lift truck of the same wheel base, because the design of the fork lift truck permits the minimum

turning radius. Finally, in stacking, the platform truck requires a clearance for the front wheels, which are directly beneath the load and must avoid the skid of the bottom of the block.

3. The platform truck is most efficient on short hauls, where all its capacities can be used to best advantage.

(2) *Types and capacities.*

*c. Warehouse tractors.*

(1) *General.*

(a) *Description.*

1. The warehouse tractor is a wheeled, self-propelled vehicle to be used for towing trailer loads. This tractor is designed to include a large amount of power in a compact and maneuverable unit. It may be mounted on either

three or four wheels. A single steering wheel usually allows shorter turns but tends to reduce stability.

2. The smaller tractor is generally equipped with solid rubber tires, but the larger tractor, as well as the models to be used outdoors, may have pneumatic tires. Whenever possible, the coupler at the rear of the tractor will be automatic so that the operator can engage or disengage trailers without leaving his seat or the controls. The tractor may be powered by a gasoline engine, a battery-electric motor, or a gas-electric power unit.
3. The gasoline engine is usually a four-cylinder, four cycle, water-cooled engine with either a magneto or a battery ignition system. The electric type carries a storage battery in a special compartment over the drive wheels of the tractor.

(b) *Use.*

1. The warehouse tractor has sufficient power to pull loads of a practical size, yet it is small and maneuverable enough to move in the limited space of warehouses and storage areas. This tractor may be used for direct drag-towing of materials along the floor on skids, for pulling one or two trailers, or for towing a long train of trailers. Where the volume of materials and the regularity of schedules warrant its

use, the trailer train is the most practical and economical method of moving materials with a warehouse tractor. In this system the tractor acts as a locomotive for a trackless train of trailers. The train moves through the storage area, spotting trailers at intervals where they are to be used and picking up trailers that are to be moved.

2. It is a common temptation to use fork lift trucks over distances so great that much of their specialized efficiency in lifting and stacking is lost. General practice has shown that when the distance the load is to be carried exceeds 250 feet, tractors and trailers should be used in conjunction with lift trucks. Efficiency is improved by allowing the tractor and trailer to do the hauling, for which they were specifically designed.

## (2) *Types and capacities.*

### *Tractors*

Draw bar pull (lb.)	Towing capacity (approx. tons)	Type tires	Gas or electric

*d. Wheeled cranes.*

(1) *General.*

(a) *Description.*

1. The wheeled crane is mounted on a wheeled, power-driven chassis to form a small mobile unit which can operate in limited spaces to lift, transport, and deposit materials which are not readily handled by other types of equipment.
2. This unit may be designed as a fixed-boom crane or as a sluing crane. In the fixed-boom crane, the boom is an integral part of the frame and can be swung only by steering the tractor on which it is mounted. On a sluing crane, the boom and hoisting unit are

mounted so that they may be swung without moving the tractor.

3. The fixed-boom crane is usually mounted on a standard tractor unit, with the boom projecting over the front wheels. The hoisting and topping units are mounted at the rear of the tractor, where the controls are easily accessible to the operator. Weights are set in the rear of the frame or in the rear wheels to counterbalance lifted loads and give added traction to the driving wheels.
4. The sluing crane is mounted on a specially designed power unit so that most of the load is supported by the driving wheels. This design creates a more compact unit, provides greater traction, and allows the engine to be placed in the rear as part of the counterweight.
5. On both types of cranes the boom can be topped to different heights to accommodate greater height of lift or greater reach, as may be desired. The hoisting unit operates independently of the vehicle's movement so that the load may be raised or lowered while the unit is traveling.
6. The cranes may be powered by a gasoline engine or by a battery-electric motor. Ordinarily, the fixed-boom crane has a gasoline engine because it is mounted on a standard tractor unit. The sluing crane is usually powered by an electric motor, since electric power

facilitates indoor use and permits a more compact design.

(b) *Use.*

1. Wheeled cranes are designed with varying capacities and can handle most lifting jobs found in storage areas. The wheeled crane is particularly useful because it handles loads which are of shapes and sizes that are moved with difficulty by other equipment. It can reach loads in places inaccessible to other types of materials-handling equipment and is flexible in use because it lifts and carries. It is small and compact and can be used in limited spaces and in the congested aisles found in small warehouses and storage areas.
2. The specific function of the wheeled crane is to provide crane facilities beyond the limitations of the rails or overhead tracks that support other types of cranes.

(2) *Types and capacities.*

#### *e. Straddle trucks.*

##### *(1) General.*

##### *(a) Description.*

1. The straddle truck is an automotive, power-operated truck designed with a high, inverted framework that enables it to pass over and straddle a unit load in order to pick it up and carry it away.
2. The inverted frame places the motor and the operator on top of the vehicle to make room for the load and give the operator better visibility. Front and rear axles are raised high above the ground so that they will pass over the load to be straddled. The four supporting wheels are at the extreme corners of the vehicle and bear the

frame on four vertical shafts, or masts. Pneumatic tires are used to increase traction and protect the unit from road shocks. All four wheels may be steered, thus increasing the truck's maneuverability.

3. Straddle trucks are built in graduated sizes, and with varying capacities. They are equipped with high-powered gasoline engines.
4. The load to be carried is originally built up on platforms on bunkers. From that point it is treated as a unit load and handled mechanically. The load is straddled along its longitudinal axis. Hoisting shoes at the bottom of the straddled truck engage the load from both sides. The load is lifted to clear the ground and carried away.

(b) *Use.*

1. The straddle truck was originally designed to handle lumber at yard and storage areas, but it has come to be used extensively for carrying many other types of long, narrow items, such as girders, rods, and pipes. It may be used for carrying containers of bulk materials. An auxiliary fork lift or winch is sometimes attached to the front of the unit to increase its usefulness.
2. The unusual design of the straddle truck gives it several advantages in materials handling. It can carry heavy,

awkward-shaped packages which other industrial trucks have difficulty in moving. It can be self-loaded and unloaded without requiring the operator to leave his control position. Four-wheel steering allows this truck a short turning radius for its size. Finally, the straddle truck is highly mobile, with the power to pull heavy loads in rough going or to travel at high speed on good roads. The straddle truck's adaptability to many tasks makes it important in reducing the movement of materials by hand.

(2) *Types and capacities.*

## SECTION VII

### PACKAGING AND CRATING

---

#### 44. PROCESSING AND PREPACKAGING

*a.* Clean articles subject to corrosion or other deterioration with either dry-cleaning solvent or soap solution.

*b.* Where necessary, remove rust with aluminum-oxide abrasive cloth or crocus cloth.

*c.* Where it is necessary, to paint, apply rust-inhibitive synthetic primer, sand and then paint surface.

*d.* Where it is not necessary to paint, apply rust-preventive compound.

*e.* Apply greaseproof wrapping paper to keep the corrosive-preventive film on the item.

*f.* Apply waterproof barrier wrapping paper and seal seams and joints with waterproof adhesive.

*g.* Select interior container considering maximum allowable weight of contents.

*h.* Use cushioning materials (wood excelsior, creped cellulose wadding, hair felt, flexible corrugated paper, etc.) for such conditions as: protection of fragile articles against shocks and impacts, protection of finished surfaces against abrasion, protection of small projections on articles, filling of voids, etc.

*i.* Block, brace, fasten or otherwise secure articles that do not fill the shipping containers, so as to pre-

vent movement in the container. (Brace by fastening wood or steel members to the shipping box in one direction, crosswise, or by cutting out portions of braces or supports to fit around a part of the machine. Bracing makes the article virtually a part of the box itself. Apply bracing to a part or parts of the article that will not be damaged by impact or by a blow sufficient to distort the box.)

*j.* Bolt articles such as machines or subassemblies. (In bolting, the article is rigidly attached to one face of the box or to a skid. Bolt articles when bracing is unnecessary or would permit damage by shock.)

*k.* Use creped paper linings for textile bags, barrels and drums where necessary to give protection against sifting, contamination, entrance or loss of water.

*l.* Where necessary, as a waterproof barrier, use lining for boxes, crates, etc. Linings should be in bag form, unless panel linings are required because of interior bracing and blocking.

## 45. INTERIOR CONTAINER TYPES

*a.* Nailed wood interior boxes.

*b.* Wire-bound interior boxes.

*c.* Fiberboard interior boxes (regular slotted, center special slotted, full telescope design, special full-flat slotted and full overlap slotted styles).

*d.* Folding cartons.

*e.* Set-up boxes.

*f.* Fiberboard cans and tubes.

*g.* Bags, greaseproof, waterproof, etc.

*h.* Metal-interior containers.

i. Glass containers, plastic containers, and collapsible metal tubes.

j. Kraft paper bags.

k. Linings for textile bags, barrels and drums.

#### 46. EXTERIOR CONTAINER TYPES

a. Sheathed nailed wood crates.

b. Unsheathed nailed wood crates.

c. Wood-cleated plywood boxes.

d. Nailed wood shipping boxes (styles 1, 2, 2½, 3, 4, 5 and 6).

e. Wirebound shipping boxes.

f. Fiberboard shipping boxes. (Fiberboard boxes are flexible and durable and do not break as easily as wooden boxes. However, the contents of the fiberboard box bear most of the weight, so that a box may look sound but the contents be badly damaged. Fiberboard boxes, therefore, should not be stacked as high as nailed wooden boxes.)

g. Wood-cleated solid fiberboard boxes.

h. Tight barrels.

i. Slack barrels.

j. Slack kegs.

k. Metal drums.

l. Metal cans and pails.

m. Plywood drums.

n. Fiberboard drums.

o. Laminated shipping bags.

p. Multiwall paper shipping sacks.

q. Textile shipping bags.

r. Bales and bundles.

s. Pallets.

t. Skids.

## 47. SELECTION OF SHIPPING CONTAINERS

a. Degree of protection required by the item—

- (1) *Easy load*—solid material (one-piece); boxed articles, paper or textiles; chest or kit of tools, wooden cabinet, boxed sturdy instruments.
- (2) *Average load*—goods in metal cans which are not packed in an inner container, bottles individually cushioned, hardware, and other articles in cartons.
- (3) *Difficult load*—long bolts and rods, dense articles such as rivets, delicate or dangerous articles such as instruments and explosives, machined parts or assemblies that require bracing, “floating,” etc.

b. Kinds of corrosion prevention and inner packaging applied to the item.

c. Weight and size of item or items to be placed in container.

d. Mode of transportation to be used (truck, railway, ship, etc.).

e. Availability of materials for making containers.

f. Time available for preparation of shipment.

## 48. STRAPPING

a. *General.* Strapping helps to keep side, top, and bottom boards from being forced loose by the weight of the contents in handling and to prevent splitting and breaking of these boards. Place straps at right angles to edges of a box and draw them tight enough to sink into the wood.

*b. Sizes of flat metal bands for various weights of boxes.*

Gross weight (pounds)	Dimensions of flat metal bands when different number of bands are used (inches)		
	1 band	2 bands	3 or more bands
Style 1 box-----			$\frac{3}{8} \times 0.020$
All other styles—			
To 70-----	$\frac{3}{8} \times 0.020$	$\frac{3}{8} \times 0.020$	$\frac{3}{8} \times 0.020$
71-125-----	$\frac{5}{8} \times 0.020$	$\frac{3}{8} \times 0.020$	$\frac{3}{8} \times 0.020$
126-175-----		$\frac{5}{8} \times 0.020$	$\frac{5}{8} \times 0.020$
176-250-----		$\frac{5}{8} \times 0.020$	$\frac{5}{8} \times 0.020$
251-400-----		$\frac{3}{4} \times 0.023$	$\frac{3}{4} \times 0.023$
401-1,000-----			$\frac{3}{4} \times 0.023$

*c. Gage of round wire for various weights of boxes.*

Gross weight (pounds)	Tensile strength per square inch					
	1 band		2 bands		3 bands	
	100,000 pounds p.s.i. (gage)	140,000 pounds p.s.i. (gage)	100,000 pounds p.s.i. (gage)	140,000 pounds p.s.i. (gage)	100,000 pounds p.s.i. (gage)	140,000 pounds p.s.i. (gage)
Style 1 box-----					15	16
All other styles—						
To 70-----	14	15	15	15	15	15
71-125-----	13	14	14	15	14	15

176-250-----			13	13	13	13
251-400-----			12	12	13	13
401-1,000-----					12	12

## 49. WOODS

### *a. Classification of woods.*

- (1) *Groups.* The woods which may be used as lumber for nailed wooden boxes are classified in the following groups:

#### *Group 1*

Aspen	Cypress	Pine, ponderosa
Basswood	Fir, alpine	(western yellow)
Buckeye	Fir, balsam	Pine, red (Norway)
Butternut	Fir, noble	Pine, sugar
Cedar	Fir, white	Pine, white
Chestnut	Magnolia	Redwood
Cottonwood	Pine, jack	Spruce
Cucumber tree	Pine, lodgepole	Willow
		Yellow poplar

#### *Group 2*

Douglas fir	Hemlock (western)	Pine, southern
	Larch (tamarack)	

#### *Group 3*

Ash, black	Elm, white	Maple, soft
Ash, pumpkin	Gum, black	Sycamore
	Gum, sweet	Tupelo, water

#### *Group 4*

Ash, white	Elm, rock	Maple, hard
Beech	Hackberry	Oak
Birch	Hickory	Pecan

- (2) *Group characteristics.* The above groups are set up so that each one is limited to woods with similar characteristics of importance to box design. These characteristics include density, flexural and compression strength, stiffness, shock absorption, and nail-holding power. Variations of the characteristics of woods within any one group are not great enough to interfere with their use in box design. Box designs

should be based on the characteristics of each group of woods.

- (3) *Use of groups.* In general, the density of woods increases in order from group 1 to group 4. There is the same progressive increase from group 1 to group 4 in strength, nail-holding power, and the other characteristics indicated above. Therefore, for a box of the same dimensions designed to carry a stated load under given conditions, the required thickness of boards is greatest when woods of group 1 are used, and least when woods of group 4 are used. Likewise, to provide the total nail-holding power required for a box, more nails, longer nails, nails of a larger diameter, or a combination of these must be used if woods of group 3 are used instead of woods of group 4, or of group 2 instead of group 3.

*b. Lumber standards.* The lumber used in the manufacture of nailed wooden boxes must meet the following standards:

- (1) Lumber will be seasoned to a moisture content of not more than 18 percent nor less than 12 percent of its oven-dry weight.
- (2) Pieces will be cut to length and dressed on at least one side.
- (3) Pieces will be free from all defects that materially weaken them, expose the contents of the box to damage, or interfere with the prescribed fabrication or nailing.
- (4) No knot will have a diameter exceeding one-third of the width of the piece.

## 50. NAILS

*a. Types of nails.* In the manufacture of wooden boxes, three types of nails are used: the standard box nail, the cooler, and the sinker. The cooler and the sinker are identical except for the head. The head of a cooler is flat on the underside, while the head of a sinker is slightly smaller and cone-shaped on the underside. The standard box nail is the same length as the cooler or the sinker but is smaller in diameter (that is, has a larger gage number).

*b. Coated nails.* Nails used in the making of boxes may be smooth or cement-coated. If two boards are to be fastened together with nails and the nails clinched in the under board, smooth nails may be used. If two boards are to be fastened together with nails not clinched, cement-coated nails should be used. Cement-coated nails frequently have from 50 to 100 percent more nail-holding power than smooth nails of the same diameter and length.

*c. Selecting nails.* A rule-of-thumb in selecting nail size is—

The size of pennies is equal to the width of the board (measured in eighths of an inch) held by the head of the nail plus two. Thus, to nail a board of  $\frac{1}{2}$ " lumber to form a box, a nail of 6-penny ( $\frac{1}{2} = \frac{4}{8}$ ;  $4 + 2 = 6$ ) is required.

*d. Nails used in the manufacture of shipping boxes.*

(1) *Coated nails.*

Size	Length (in.)	Gage	Approximate number per pound
2-penny -----	1	16½	1,300
3-penny -----	1⅛	16	950
4-penny -----	1⅜	15½	710
4½-penny -----	1½	15½	650
5-penny -----	1⅝	15	536
6-penny -----	1⅞	13½	306
7-penny -----	2⅛	13½	268
8-penny -----	2⅜	12½	186
9-penny -----	2⅝	12½	167
10-penny -----	2⅞	11½	118

(2) *Smooth box nails.*

Size	Length (in.)	Gage	Approximate number per pound
2-penny -----	1	15½	1,010
3-penny -----	1¼	14½	635
4-penny -----	1½	14	473
5-penny -----	1¾	14	406
6-penny -----	2	12½	236
7-penny -----	2¼	12½	210
8-penny -----	2½	11½	145
9-penny -----	2¾	11½	132
10-penny -----	3	10½	94
12-penny -----	3¼	10½	88
16-penny -----	3½	10	71
20-penny -----	4	9	52
30-penny -----	4½	9	46
40-penny -----	5	8	35

(3) *Sinkers or coolers, coated.*

Size	Length (in.)	Gage	Approximate number per pound
2-penny -----	1	16	1,084
3-penny -----	$1\frac{1}{8}$	$15\frac{1}{2}$	848
4-penny -----	$1\frac{3}{8}$	14	488
5-penny -----	$1\frac{5}{8}$	$13\frac{1}{2}$	364
6-penny -----	$1\frac{7}{8}$	13	275
7-penny -----	$2\frac{1}{8}$	$12\frac{1}{2}$	212
8-penny -----	$2\frac{3}{8}$	$11\frac{1}{2}$	142
9-penny -----	$2\frac{5}{8}$	$11\frac{1}{2}$	130
10-penny -----	$2\frac{7}{8}$	11	104
12-penny -----	$3\frac{1}{8}$	10	77
16-penny -----	$3\frac{1}{4}$	9	61
20-penny -----	$3\frac{3}{4}$	7	37
30-penny -----	$4\frac{1}{4}$	6	29
40-penny -----	$4\frac{3}{4}$	5	21
50-penny -----	$5\frac{1}{4}$	4	16
60-penny -----	$5\frac{3}{4}$	3	13

*e. Size of nails for fastening top and bottom to sides.*

Thickness of side (in.)	Size of nails		
	Group I wood	Group II wood	Groups III and IV wood
Under $\frac{1}{2}$ -----	None -----	None -----	None.
$\frac{1}{2}$ to $\frac{3}{64}$ -----	6-penny -----	5-penny -----	4-penny.
$\frac{5}{8}$ to $\frac{7}{8}$ -----	7-penny -----	6-penny -----	5-penny.
$\frac{15}{16}$ to $1\frac{1}{16}$ -----	8-penny -----	7-penny -----	

*f. Spacing of nails.<sup>1</sup>*

Size of nails	Spacing <sup>2</sup> (in.)	
	When driven into side grain of end	When driven into end grain of end
6-penny or smaller.....	2	1¾
7-penny.....	2¼	2
8-penny.....	2½	2¼
9-penny.....	2¾	2½
10-penny.....	3	2¾
12-penny.....	3½	3
16-penny.....	4	3½
20-penny.....	4½	4

<sup>1</sup> Except the nailing of top and bottom of sides.

<sup>2</sup> The spacing of cement-coated nails fastening the sides, tops or bottoms to the ends and cleats shall not be greater than that given in this table. When, because of small knotholes or checks in the nailing end, it is necessary to exceed this spacing, the distance between any two adjacent nails shall not be greater than 1½ times the spacing given in this table.

# 51. NAILS AND LUMBER FOR STYLES 1, 2, 2½, 4, AND 5 NAILED WOODEN BOXES (TYPE 3)

Weight of contents (lb.)	Style of box :	Woods of groups 1 and 2				Woods of groups 3 and 4				Minimum thickness and width of cleats (in.) <sup>1</sup>
		Minimum thickness of sides, tops, and bottoms (in.) <sup>1</sup>	Size of nail for nailing sides, tops, and bottoms to ends and cleats		Minimum thickness of ends of cleats (in.) <sup>1</sup>	Minimum thickness of sides, tops, and bottoms (in.) <sup>1</sup>	Size of nail for nailing sides, tops, and bottoms to ends and cleats		Minimum thickness and width of ends of cleats (in.) <sup>1</sup>	
			Group 1 (penny)	Group 2 (penny)			Group 3 (penny)	Group 4 (penny)		
To 100-----	4 or 5-----	1½	8	7	¾	¾ x 2¼	1/16	5	5	5/8 x 1¾
To 100-----	2 or 2½-----	1½	7	6	5/8	5/8 x 2¼	1/16	5	5	5/8 x 1¾
101-250-----	4 or 5-----	5/8	8	7	23/32	23/32 x 2½	1/2	6	5	¾ x 2¼

601-800-----	2 or 2½-----	11/16	10	9	1 1/16	1 1/16 x 3¼	¾	8	7	13/16 x 2¾
801-1,000-----	2 or 2½-----	1 1/16	12	12	1 5/16	1 5/16 x 4½	7/8	9	8	1 1/16 x 3 3/8

<sup>1</sup> When minimum thickness shown is exceeded, nail sizes will be increased to correspond.

<sup>2</sup> Where depth of cleated-style box is 5 inches or less, each side and each end will be made from one piece, and the thickness of ends will not be less than the combined thickness of the end and cleat specified above.

## SECTION VIII

### GRAVES REGISTRATION

---

#### 52. GENERAL

The Quartermaster General has responsibility for the establishment and organization in time of war of a Graves Registration Service for the purpose of insuring identification and proper burial of American military personnel who die outside the continental limits of the United States. To fulfill this responsibility, trained graves registration companies must be prepared to follow combat units in order that immediate recovery and evacuation of deceased personnel may be accomplished, and that proper identification and burial may be assured.

#### 53. RECOVERY AND EVACUATION

*a.* The graves registration company is normally assigned to the Army on the basis of one platoon of a graves registration company to support a combat division.

*b.* Combat units will usually evacuate remains to a battalion, regimental, or division collecting point where personnel of the graves registration platoon will receive the remains.

*c.* Remains are evacuated by graves registration personnel from the collecting point to the site of the temporary military cemetery.

d. Identification is verified at the cemetery by trained *identification technicians*. Items of personal effects are removed from the remains, properly inventoried, recorded and transported to the class II and IV depot designated to receive personal effects.

e. Burial is recorded by plot, row, and grave number.

## 54. IDENTIFICATION

a. Initial identification is performed at the collecting point in order that maximum information may be obtained concerning the identity of the deceased from members of his unit when sufficient identification is not present on the remains.

b. The emergency medical tag placed on the remains should include the name, rank, serial number of the decedent, date and place of death, and designation of his unit. *Personal effects should not be removed from the remains until remains arrive at cemetery and positive identification has been made (par. 55).*

c. Identification prior to burial will be made at the cemetery, if not previously established, and all data utilized in initial identification at the collecting point will be rechecked at the cemetery. Identification tags and all items of personal effects on the remains will be meticulously scrutinized in an effort to establish positive identification.

d. Fingerprints will be taken prior to burial of remains in those cases where there is a question of identity.

e. Scars, tattoos and other physical characteristics

which may be valuable in later investigations will be recorded.

## 55. PERSONAL EFFECTS

a. Personal effects are not removed from the remains until arrival at the cemetery.

b. After identification has been established, personal effects found on the remains will be removed prior to interment.

c. Personal effects of a non-Government issue nature will be inventoried, packaged and transmitted to the communications zone installation designated to handle effects for shipment to the Effects Depot in the continental United States and ultimate delivery to the next of kin.

d. When identification *cannot* be made, the personal effects of the unidentified deceased will be inventoried, packaged, and transmitted as in c above to the communications zone installation which handles effects to be shipped to the Effects Depot in the Continental United States. However, one complete copy of the report of burial, together with a notation of any other pertinent information, will be inclosed in the package containing the effects.

## 56. TEMPORARY MILITARY CEMETERIES

a. The establishment of division cemeteries will be held to a minimum. This will necessarily depend upon the tactical situation.

b. The site for a temporary military cemetery will usually be selected by a representative of the army or corps commander.

c. Selection of the temporary cemetery site

should be carefully made taking into consideration the following factors:

- (1) The site should be near a good road network on high level ground free from rock formation.
- (2) Site should have a low water table.
- (3) Site should not be low or swampy terrain.

*d.* The Corps of Engineers should be consulted in the selection and layout of the cemetery.

## 57. BURIALS

*a.* Graves will be prepared by attached service troops or prisoners of war. The dimensions of a grave are 5 feet in depth, 6½ feet in length, 3 feet in width. The intervals between each grave are 3 feet laterally from the edge of the adjoining grave opening and 4 feet linearly from the edge of preceding open grave.

*b.* Graves are aligned in both directions.

*c.* One identification tag will be interred with the remains and one tag firmly affixed to the grave marker.

*d.* Care will be taken to place a cross or a star of David on the grave in accordance with the religious preference of the decedent. The grave marker is placed at the head of the grave at a point 1½ feet from the edge of the grave opening.

*e.* Grave location will be carefully recorded on the cemetery plot map and on the burial report.

*f.* Graves are numbered usually from left to right and the rows from rear to front.

*g.* The burial report will be accomplished in every detail. One copy will be retained in the cemetery

files and the other copies will be distributed in accordance with issued instructions.

h. Landscaping should be held to a minimum. Permanent buildings or other permanent type facilities should not be constructed since these cemeteries are considered temporary. Cemeteries will be seeded where possible and properly maintained to present the appearance of dignified simplicity.

## SECTION IX

### TRANSPORTATION

#### 58. MOTOR TRANSPORTATION

*a. Vehicle capacities (truck capacities for cargo, men and equipment).*

Trucks	Cargo <sup>1</sup>		Men and equipment <sup>1</sup>
	Poor, rough road	Good, hard-surfaced road	
1/4-ton-----	-----	-----	<sup>2</sup> 3
3/4-ton-----	-----	-----	<sup>2</sup> 8
1 1/2-ton-----	-----	-----	<sup>2</sup> 15
2 1/2-ton 6 x 6 LWB:			
With trailer-----	3 1/2 tons--	5 tons--	25
Without trailer-----	2 1/2 tons--	do-----	25
2 1/2-ton 6 x 6 SWB:			
With trailer-----	3 1/2 tons--	do-----	18
Without trailer-----	2 1/2 tons--	do-----	18
2 1/2-ton 6 x 6 COE, 15 or 17-ft body (no tlr).	2 1/2 tons--	do-----	30
5-ton truck-tractor w/10-ton semitrailer.	( <sup>3</sup> )	10 tons--	40
5-ton truck-tractor w/2,000-gal tank, semitrailer.	( <sup>3</sup> )	2,000 gallons.	

<sup>1</sup> Trucks carrying either cargo, or men and equipment—not both.

<sup>2</sup> This figure represents men, excluding driver.

<sup>3</sup> Not generally used.

*b. Pertinent data for Army vehicles.*

## 59. RAIL TRANSPORTATION

## a. Capacity of standard United States military railway cars.

Type of car	Gage	Capacity <sup>1</sup>		Weight empty in tons	Inside dimensions		
	Ft.-in.	Tons	Cu. ft.		Length	Width	Height
Box.....	4-8½	20	---	9	239½	7-7½	6-5
Do.....	3-3¾	30	---	15	34-6	7-1	6-1
Do.....	3-6	30	---	15	34-6	7-1	6-1
Do.....	4-8½	40	---	20	39-9	8-0	6-9
High-side gondola.....	4-8½	20	---	8	23-9½	7-6	3-4-0
Do.....	3-6	30	---	10	34-6	6-11½	3-4-0
Low-side gondola.....	3-3¾	30	---	9	34-6	6-11	3-1-6
Do.....	4-8½	40	---	18	40-6½	7-6	3-1-6
Flat.....	4-8½	56	---	17.5	40-9	8-5	
9,900-gallon tank.....	4-8½	40	---	20	37-2	3-6-9	
5,000-gallon tank.....	3-6	30	---	16	27-6	3-5-6	
Refrigerator.....	4-8½	35	---	21	32-8	6-11	6-6

<sup>1</sup> Capacity for personnel may be computed on a basis of 8 square feet per man and equipment for those cars suitable for this purpose.<sup>2</sup> Height of sides.<sup>3</sup> Diameter.

*b. Characteristics of standard United States commercial railway cars.*  
 (1) *Passenger cars.*<sup>1</sup>

1	2	3	4
Item	Day coach <sup>2</sup>	Tourist pullman	Standard pullman <sup>3</sup>
Length in feet.....	65-75	65-75	65-80
Number of sections.....	None	13-16	12-16
Maximum seating, 2 men to each double seat <sup>4</sup> .....	60-70	52-64	53-64
Maximum seating, 3 men to each 2 double seats <sup>4</sup> .....	45-52	39-48	40-48
Maximum sleeping, 2 men per berth.....	None	52-64	53-64
Sleeping capacity, 3 men per section.....	do.	39-48	40-48
Sleeping capacity, 1 man per berth.....	do.	26-32	27-32

<sup>1</sup> Most of the new types are not listed.

<sup>2</sup> Limited number of steel coaches, 70 feet long or over, available.

<sup>3</sup> 12 sections and drawing room or 16 sections and no drawing room.

<sup>4</sup> Double seat—A seat having the capacity of 2 men.

## (2) Freight cars.<sup>3</sup>

Type of car	Gage Ft.-in.	Capacity <sup>1</sup>		Weight empty in tons	Inside dimensions		
		Tons	Cu. ft.		Length	Width	Height
Box <sup>2</sup> .....	-----	30	2,750	18	36	8-6	9
Do.....	-----	40	3,100	20	40-6	8-6	9

Automobile.....	-----	40	3,100	20	40-6	8-6	9
Do.....	-----	50	3,850	25	50-6	8-6	8
Baggage.....	-----	-----	-----	45	60	9-1	7
Caboose.....	-----	-----	-----	20	27-6	8-2	8-6
Diner.....	-----	-----	-----	90	78-6	8-6	8-6

<sup>1</sup> There are no "standard" dimensions of commercial cars. Figures given here are for some types in common use.

<sup>2</sup> Approximately 80 percent of all box cars in use are between 40 and 42 feet inside length.

<sup>3</sup> The Official Railway Equipment Register published by the Railway Equipment & Publication Co., 424 W. 33d St., New York, N. Y., shows by individual car initials and numbers, the marked capacity, length, dimensions and cubic capacity of all American railway cars used to transport freight.

*c. Maximum bulk loading for standard U. S. freight cars.\**

Capacity of cars in tons.....	30	40	50
Item	Actual capacity of cars in tons		
Ammunition.....	30	40	50
Blankets, baled.....	27	32	40
Bread.....	19	24	30

Deadweight tonnage-----	10,800	10,600	10,850	9,100	5,000	16,760	10,800
Measurement tonnage space:							
Dry cargo-----	11,500	11,750	11,750	11,400	5,675	375	-----
Refrigerated cargo-----					275	-----	-----
Barrel cargo capacity-----	5,000				4,000	141,000	65,000
Number of holds-----	5	5	5	5	4	9	9
Ton capacity of heaviest boom-----	50	50	50	30	30	5	5

\*See additional data relating to the Liberty ship (EC2).

*b. Additional data relating to the Liberty ship (EC2).*

Capacity below deck	Hatch 1	Hatch 2	Hatch 3	Hatch 4	Hatch 5
Hatch dimensions.....	33' 9" x 20'	33' 9" x 20'	35' x 20'	33' 9" x 20'	20' x 20'
Cargo space in M/Ts—					
Hold.....	900	2,300	1,500	1,300	1,300
Between decks.....	1,000	1,100	600	700	800
Deep tanks.....	140	270	460		

## 61. AIR TRANSPORTATION

*a. Airplane.* Delivery by airplane to the airhead is the most efficient method but requires an air strip at the unloading point for loading purposes. The following table shows cargo-carrying characteristics of carrier aircraft:

### *Cargo-Carrying Characteristics of Carrier Aircraft*

*Note.* Distances are in nautical miles (Conversion factor: 1 nautical mile equals 1.16 status miles).

Type of aircraft	Range 500 miles	Range 1,000 miles	Range 1,500 miles	Range 2,000 miles	Range 3,000 miles
	Pounds	Pounds	Pounds	Pounds	Pounds
C-46.....	11,872	10,250	7,000	4,000	0
C-47.....	7,500	5,000	3,700	2,000	0
C-54.....	20,000	20,000	18,900	15,700	6,000
C-82.....	11,775	11,000	6,400	2,350	0
C-74.....	44,000	35,000	27,500	20,000	6,000
C-119.....	20,000	18,000	11,000	5,500	0
YC-97.....	41,500	35,000	28,000	22,000	10,000
C-97 A.....	Maximum	36,000	36,000	32,500	22,600
C-124.....	Maximum	47,300	40,000	32,300	17,000

*b. Glider.* Delivery by glider is expensive but can be accomplished without the use of a prepared air strip. The following table shows characteristics of gliders:

*Characteristics of Gliders*

Type glider	Pay load	Cruising speed
CG-15A.....	4,600	150
CG-18A.....	8,000	( <sup>1</sup> )
CG-20A.....	16,000	190

<sup>1</sup> Speed of CG18A depends on speed of airplane.

*c. Parachute.* Delivery by parachute is comparatively inefficient and should be used only when more desirable methods are not available. The following table gives weights and capacities in air delivery:

*Weights and Capacities in Air Delivery*

Type of Load	Diameter (feet)	Weight (pounds)	Average safe load (pounds)	Gross weight (pounds) (canopy, container and safe load)
Canopy parachute air delivery—				
G1.....	24	20	300	320
Air delivery:				
Type A-4.....	24	13.25	100	135.25
Type A-5.....	24	42	175	237
Type A-6.....	24	15	150	185
Type A-7.....	24	50	150	170
Cargo net.....	24	11	189	220
Cargo dropping by parachute:				
G2.....	24	55	3,000	-----
G3.....	28	75	3,000	-----
G4.....	36	98	3,000	-----
G5.....	48	138	3,000	-----

G-3 Cargo parachute 28-foot:

<i>Safe load (not to include rigging) (pounds)</i>	<i>Rate of descent (feet per second)</i>	<i>Safe load (not to include rigging) (pounds)</i>	<i>Rate of descent (feet per second)</i>
500-----	40	2,000-----	80
1,000-----	57	2,500-----	87
1,500-----	70	3,000-----	97

G-4 Cargo parachute, 36-foot:

<i>Safe load (not to include rigging) (pounds)</i>	<i>Rate of descent (feet per second)</i>	<i>Safe load (not to include rigging) (pounds)</i>	<i>Rate of descent (feet per second)</i>
500-----	32	2,000-----	63
1,000-----	44	2,500-----	70
1,500-----	55	3,000-----	77

G-5 Cargo parachute, 48-foot:

<i>Safe load (not to include rigging) (pounds)</i>	<i>Rate of descent (feet per second)</i>	<i>Safe load (not to include rigging) (pounds)</i>	<i>Rate of descent (feet per second)</i>
500-----	25	2,000-----	47
1,000-----	35	2,500-----	53
1,500-----	42	3,000-----	58

90 ft. cargo parachute—Maximum 6,000 pounds limit:

<i>Safe load (not to include rigging)</i>	<i>Rate of descent (feet per second)</i>
2,700-----	24.4
1,500 feet, minimum safe altitude.	

85-foot ribbon cargo parachute—6,000 pounds limit:

<i>Safe load (not to include rigging)</i>	<i>Rate of descent (feet per second)</i>
3,000 pounds-----	22.4
4,000 pounds-----	25
1,500 feet, minimum safe altitude.	

*d. Type loads for each delivery unit.* The shape and strength of the various types of air delivery units are to be taken into consideration in the delivery of different types of supplies.

- (1) *Type A-4.* Type A-4 load consists of packaged rations, small spare parts, light radios, medical supplies and light equipment.

- (2) *Type A-5.* Type A-5 load consists of arms, ammunition, rations, medical supplies, engineer tools, sturdy equipment, and standard metal containers filled with gasoline, oil and water.
- (3) *Type A-6.* Type A-6 load consists of rations, ammunition, in bundles, light radios, and medical supplies.
- (4) *Type A-7.* Type A-7 load consists of ammunition boxes..
- (5) *Cargo net.* The cargo net consists of irregularly shaped loads, ammunition in boxes, sturdy equipment that does not require additional packing or protection, and metal containers of gasoline, oil or water.

## SECTION X

### TABLES OF WEIGHTS, MEASURES AND CONVERSIONS

#### 62. WEIGHTS AND MEASURES OF VARIOUS NATIONS <sup>1</sup>

Country	Weight or measure	English or American equivalent	Metric equivalent
Abyssinia.	ardeb -----	0.115 to 0.333 bu.	4.039 to 11.745 l.

km.	kilometer	yd.	yard

<sup>2</sup> The weights and measures of Afghanistan are like those of Arabia, India, and Persia.

<sup>3</sup> The metric system is legal and obligatory. Compare Hungary.

<sup>4</sup> These names are used only occasionally.

<sup>5</sup> The Spanish measures are still in use.

<sup>6</sup> The former Portuguese system is still largely used.

<sup>7</sup> A great variety of weights and measures, more than can be here enumerated, are found in different provinces. Grains and liquids are measured largely by weight.

<sup>8</sup> The weights and measures of Canada are the same as those of Great Britain, but in some parts of lower Canada various old French terms are still in use.

<sup>9</sup> In China almost everything is sold by weight, so that dry and liquid measures are little used.

<sup>10</sup> The weights and measures of Great Britain are practically the same as those of the United States, which are derived from them. The common United States standard (Winchester) gallon contains 231 cubic inches; the British imperial gallon contains 277.274 cubic inches. The United States standard (Winchester) bushel contains 2,150.4 cubic inches; the British imperial bushel contains 2,218.2 cubic inches. Certain British units little used in the United States are noted in the table.

<sup>11</sup> The weights and measures of Great Britain are in general use in Hongkong.

<sup>12</sup> The old Spanish weights and measures are still in use—Statesman's Year-book (1932).

<sup>13</sup> The weights and measures of Argentina are also in general use.

<sup>14</sup> The *mans* are many and various, from the *man-i-tabric* (6.49 pounds; 2.933 kilograms) to the *man-i-hasheni* (116.8 pounds; 52.98 kilograms).

<sup>15</sup> The metric system was in use at the time the United States took possession, and its continued use was authorized by the Philippine Commission 17 September 1901. The names of the weights and measures given in the table are from the official tables of the United States Census of the Philippine Islands, 1903, volume IV, pages 448 et seq. Great variations in the quantities represented by these names are found in different islands and provinces.

<sup>16</sup> The *pico* varies from 39 kilograms in Sorsogon to 69.012 kilograms in Leyte.—*Ibid.*, page 447. Other weights or measures of the old system vary in a similar way.

<sup>17</sup> The metric system of weights and measures became general as from 1 January 1933.

<sup>18</sup> The metric system of weights and measures became the official system as of 18 May 1912.

\*The metric system is legal and obligatory; however, the old weights and measures may still be in use.

#The metric system is legal but not obligatory or not in general use among the people.

## 66. TEMPERATURE CONVERSION

$$\text{Centigrade} = 5/9 (\text{F} - 32)$$

$$\text{Fahrenheit} = 9/5\text{C} + 32$$

$$\text{Centigrade} = 5/4\text{R}$$

$$\text{Reaumur} = 4/5\text{C}$$

$$\text{Fahrenheit} = 9/4\text{R} + 32$$

$$\text{Reaumur} = 4/9 (\text{F} - 32)$$

## 67. CUBIC MEASURE

$$1728 \text{ cubic inches} = 1 \text{ cubic foot}$$

$$27 \text{ cubic feet} = 1 \text{ cubic yard}$$

## 68. SQUARE MEASURE

144 square inches	= 1 square foot
9 square feet	= 1 square yard
4,840 square yards	= 1 acre
70 yards square	= 1 acre (approximately)
43,560 square feet	= 1 acre
640 acres	= 1 square mile
272 $\frac{1}{4}$ square feet	= 1 square rod (perch)

## 69. LINEAR MEASURE

16 $\frac{1}{4}$ feet	= 1 rod
5 $\frac{1}{2}$ yards	= 1 rod
40 rods	= 1 furlong
8 furlongs	= 1 mile
320 rods	= 1 mile
1,760 yards	= 1 mile
5,280 feet	= 1 mile
3 miles	= 1 league

## 70. VOLUME

1	2	3	4	5	6
Unit	Cubic feet	Imperial gallon	U. S. gallon	Liters	Quarts
One cubic foot =		6.229	7.481	28.32	29.92
One Imperial gallon =	.16054		1.2010	4.546	4.804
One U. S. gallon =	.13368	.8327		3.785	4.000
One liter =	.03532	.2201	.2642		1.0567
One measurement ton =	40				

## 71. MARINER'S MEASURE

6 feet	= 1 fathom
100 fathoms	= 1 cable length
7 $\frac{1}{2}$ cable lengths	= 1 mile
5,280 feet	= 1 statute mile
6,080.2 feet	= 1 nautical mile

## 72. MEASURES OF WEIGHT

<i>Metric</i>	<i>U. S. (or British (avoirdupois))</i>
Millier (tonneau, metric ton).....	2,204.6 pounds.
Quintal.....	220.46 pounds.
Myriagram.....	22.046 pounds.
Kilogram.....	2.2046 pounds.
Hectogram.....	3.5274 ounces.
Decagram.....	.3527 ounces.
Gram.....	15.432 grains.
Decigram.....	1.5432 grains.
Centigram.....	.1543 grains.
Milligram.....	.0154 grains.

## 73. MEASURES OF LENGTH

<i>Metric</i>	<i>U. S. (or British)</i>
Myriameter.....	6.2137 miles.
Kilometer.....	.62137 mile.
Hectometer.....	328 feet 1 inch.
Decameter.....	393.7 inches.
Meter.....	39.37 inches.
Decimeter.....	3.937 inches.
Centimeter.....	.3937 inch.
Millimeter.....	.03937 inch.

## 74. WEIGHT

1	2	3	4	5	6
Unit	Long tons	Metric tons	Short tons	Kilo- grams	Pounds
1 long ton.....		1.0160	1.1200	1,016.	2,240.
1 metric ton.....	0.9842		1.1023	1,000.	2,204.6
1 short ton.....	.8929	.9072		907.2	2,000.
1 kilogram.....					2.2046

## 75. SHIPPING EQUIVALENTS

Weight	Equivalent
Average short ton of military supplies with stowage.	2.2 ship (measurement) tons.
Average short ton of military supplies without stowage.	1.9 ship (measurement) tons.
Average long ton of military supplies with stowage.	2.464 ship (measurement) tons.
Ship (measurement) tonnage.	<u>Bale cubic capacity</u> 40
Deadweight tonnage.....	.85 ship (measurement) tonnage.
Effective deadweight tonnage.	.80 deadweight tonnage.
Deadweight tonnage.....	1.5 gross registered tonnage.
Gross tonnage.....	.6 deadweight tonnage. <sup>1</sup>
Net tonnage.....	.4 deadweight tonnage. <sup>1</sup>

<sup>1</sup> Approximate relation of freight ships of 10,000 deadweight tons.

## 76. MEASUREMENT OF SURFACES AND SOLIDS

Figure	Relation	Measurement
Circumference of a circle..	equals ..	Diameter times 3.1416.
Area of a triangle.....	equals ..	Base times altitude divided by 2.
Area of a square or an oblong.	equals ..	Length times breadth.
Area of a circle.....	equals ..	Square of the diameter times .7854. or Square of the radius times 3.1416.
Area of the sector of a circle.	equals ..	Length of the arc times the radius divided by 2.

Figure	Relation	Measurement
Area of any right-lined figure of four or more unequal sides.	equals --	Division of the figure into triangles, finding of the area of each triangle, and adding of the areas.
Area of an ellipse-----	equals --	Long axis times the short axis times .7854 (length times perimeter).
Surface of a cone or a pyramid.	equals --	One-half of slant height times perimeter of base plus area of base.
Surface of a cube-----	equals --	Sum of areas of all the sides.
Surface of a sphere-----	equals --	Square of the diameter times 3.1416.
Cubic content of a prism or cylinder.	equals --	Area of the base times the height.
Cubic content of a cone or a pyramid.	equals --	$\frac{1}{3}$ (area of base times altitude).
Surface of a prism or a cylinder.	equals --	Area of 2 ends plus (length times perimeter).
Cubic content of a cube----	equals --	Length times breadth times depth.
Cubic content of a sphere--	equals --	Cube of the diameter times .5236.
